The 40 meter legs pretty much cover 15m for instance.. I've never added
15m legs, as I always have 40 legs.. I have often added 20m legs though,
as the 40m as a half wave on 20 is the pits when coax fed.. :(

> autotuner up.

Yep.. But I've always like the parallel fed dipoles.
It's almost a perfect system. When tuned and operated correctly, the dipoles function pretty much the same as single band dipoles, with no tuner needed, and pretty much the same efficiency as a single band dipole fed with coax. For multi band use, it's more efficient than most any other scheme I can think of as far as the bands that have dipoles, or have a good match for other reasons. IE: 3/4 wave resonance. The one here at the house is 80/40/20. The one up in the country is 80 and 40. I did also have 160m legs on that one at one time, but a storm whacked it out, and when I rebuilt it, I didn't bother with the 160m legs.
If I want to use a higher band, I use a tuner and accept the small loss.. I actually don't get on the higher bands much.. I'm on 40 in the day, and 80 at night most all of the time. Also 160 at night if I have it, but that is a bit seasonal.. You won't see me on 160 much in the summer.. So much noise, you really need an amp, and none of the amps I have work 160m.

1176. Very Huge collection of Solutions Manuals & Test Banks

Well I modelled it and matched it fine on the two bands The ends of the
feeder are about 4" apart and effectively the inner ends of the longer dipole
are an 8" length of 600 ohm line, so that length comes off the 12m dipole
elements. I couldn't get it to match with it as a genuine fan (inner ends
paralelled) with any small spacing at the ends of the dipoles, so I made them
about 8" apart.

Then they matched up nicely. The feeder is short, and low loss, as seen by
the out of band (mis)match.

The trick is to make the dipoles far enough seperated so as to be seen by the
feeder as seperate elements. This lost me much time.

EZNEC lacks an optimiser. Try 4NEC2 and let the optimiser tweak the
wire lengths for best VWSR in the various bands.
<http://www.youtube.com/watch?v=kYy6Yur127A> 25min
The bad news is that since the fan dipole works on several bands, the
optimizer has to be run individually for each band. Fortunately, it
is easy to limit the parameters that it changes to just the wire
length for that band in question. I'm tempted to build an NEC2 model
and see what happens. Maybe this weekend.

I blundered across this article on fan dipole construction:
<http://www.hamuniverse.com/multidipole.html>
<http://sstowers.com/aa4cv/>
If I can find a long straight location, that doesn't come too close to
a tree, I might try a fan dipole again.

Why not put a quarter wave stub for 10metres about half wave down from the
top to make it radiate as two half waves in phase on 10? That would also
guive a little loading on the more LF bands increasing efficency slightly.
I'm not sure without checking what the effect on the bands below 20 would be.

Mostly because of the mechanical complexity of doing that and the winds
here can exceed 60 MPH.

Inserting a trap is much simpler and catches less wind.

If I were going to do that, I would use ladder line between the elements and connect the coax to the bottom.

It would be easy to model this with EZNEC, even the free demo version, so I would do that first.

This comes after my earlier reply about wanting to see the model.

When I did the modeling mentioned above, I modeled the dipoles in a fan configuration connected to a common short connection and varied the angle between the dipoles and the length of one dipole.

I just did another series of models this time as parallel dipoles separated by 6 inches connected to a short (1 inch) common section for the feed point.

The top dipole was set to be roughly resonant at 30 Mhz and the lower dipole was initially set to be twice as long.

After saving the SWR plot, I repeated for length ratios of 1.5:1, 1.25:1, 1.1:1, and 1.05:1.

Short summary:

The top dipole remained fixed in length but the lowest SWR point shifted slightly for the higher frequency.

The lowest SWR's at both frequencies were both under 1.5:1 over the range of 2:1 to 1.05:1 for the length ratios.

Therefor either fan dipoles behave differently than parallel dipoles or I screwed something up in the previous run.

I'm going to have to run fans again and this time save the results.

If anything interesting turns up, I can put all the data on a web server somewhere and post it for those interested.

1190. Seeking New FAQ/Intro Maintainers for rec.radio.amateur.*

Newsgroup: rec.radio.amateur.antenna
Date: 2012-05-07 06:05:01 UTC
From: rram@panix.com
Message-ID: <radio/ham-radio/recruitment-1-1336370700@panix.com>
Source record: 1957
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.info

```
Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:
```

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Anyone have good success with a noise filter power bar? I am looking at the Monster Power Blackout HDP 660.

I am getting a lot of electrical noise, RFI and I know some comes from the TV, but when TV is off there is still some anoying noise that I am thinking a EMI RFI Noice filter would help to reduce this. The rig is 40 years old.

Anyone have any cheap comments regarding any power bar or surge protector that have the best RFI EMI noice filtering?

Thanks
73s

Probably a dumb question, but is the noise for sure coming in through
the rigs power plug? You took off the antenna and the noise is still
there right? Cause if it's gone with the ant off a power line filter
won't help much.

Monster products are something any EE wishes they thought of, but none of them did because they are a ripoff, at least from the price/performance perspective and engineers normally aren't in that business.

Oxygen free copper, ways of winding the strands so they work better, all BS when it comes to signal delivery and the ability of the human ear to perceive it. It's almost as bad as damping factor.

I love the line voltage regulators they sell. Like the voltage regulators in every single piece of equipment plugged into the line don't work.

I agree with the comments here. I doubt you will get success with this product or improvements with any Monster product.

I had a microwave that made noise in my receiver, a lot. It was coming in from the antenna, not the power line. I figured the microwave was radiating noise into the power line and thence to my antenna. I took the microwave apart and installed an inductor capacitor module to suppress the noise within the steel cabinet. That worked. These modules are not cheap, even on ebay. Getting a module like this for 15 amps cost me 27 bucks on ebay. \

Once you let the noise out of the enclosure into a power cord, the power cord will radiate even if there is any suppression at all in an external filter.

Like I said, you will need an inductor capacitor filter mounted inside your tv or other device that is radiating emi. Most people are unwilling to get that serious about things.

There is another horrible possibility. A friend who lived in an apartment got terrible noise from an adjacent apartment that had a large plasma tv. LCD tvs don't do this. The noise was actually radiating directly from the screen. Nothing to be done. He got them to take back their new tv for full credit and buy an lcd tv. He sweetened the deal with 100 bucks. LCD tvs generally cost a bit more than plasma.

As was already said, take off the antenna and if the noise goes away, a power line filter will do nothing.

Just a skoshie clarification, if I may. Can we please restate that that
only applies to power line filtering on the victim device? You said it
nicely in your earlier text, but the summary sentence [quoted] left an
opening for the reader possibly to rule out all power line filtering.

I hope this helps.

You haven't yet said if you tried disconnecting the antenna and whether
or not the noise was still there. That's the first test, and the best way
to determine if the noise is coming through the power line or the
antenna.

Sometimes we forgot the advice suggested in earlier
posts which might have cleared the problem or put
us on the right track. It was a very worthy point and
I just wanted to be sure AJL followed up on it.

It is nice to see things running smooth here again.
I truly consider this one of the best groups available
for hams -- antennas are sometimes very difficult
to understand and I've seen a lot of positive advice
here -- and learned a lot as well!

You don't need a good match, particularly at lower frequencies where atmospheric noise dominates. You want low impedance (static and all that).. what about a loop and a transconductance amplifer (current in)..

You're not building a transmitting antenna or trying to get the best possible noise figure, so match isn't a big deal.

You could probably use a resistively loaded whip and be done with it.

In fact, try a few meter vertical or something like that before you work too hard.

I use one on my PCR1000 and it works pretty well. Sure, I'm not going to dig out those faint signals, because they're overwhelmed by the noise from other areas.

The other thing you might find useful, and simple, is to use two crossed vertically oriented loops and make it possible to switch between them. Then, you could place the null on a potential inteferer.

But I'd start with something like 10-15 feet of wire and see how it works.

It's quite possible that poor or no feed line decoupling could be a
culprit also.
With no decoupling, the coax will pick up shack/house noise on the
outer side of the shield, and pipe it back to the receiver on the
inside of the shield. Assuming coax anyway..
Of course, far off noise is more likely to be received by the antenna
itself, and even a system with a decoupled feed line would still
receive the noise.

A power bar isn't going to help much:
<http://www.powerbarstore.com>

As others have suggested, find the source of the noise, and then think
about solutions. In my house, it's the multitude of wall warts and
switching power supplies that generates the bulk of the noise. These
switchers turn off when not charging or powering anything. So, no
noise when they're plugged in, but not being used. Consider using
clamp-on split ferrite filters if you suspect that the noise is being
conducted down the power line.

Light reading:
<http://audiosystemsgroup.com/SAC0305Ferrites.pdf>
Although the article is on audio noise suppression, it applies equally
well to RF noise suppression.

Thanks for the great advice, I never thought about unhooking the coax to eliminate that but I know there is also noise coming from the plazma tv, when it is on, I hear the static, and it immediately stops the static when the TV is shut off. Now I have read that the screen can transmit through air the interferrence. I will try the coax unhook today to see isoloate more. That just makes so much sense. Thanks again and I will try this today.

Hi, We have a 40 foot galvanized aluminum antenna tower attached to our house that we don't use & I was thinking about selling it. There are four ten foot sections & the top has some kind of box looking thing & round antenna rods. Any ideas on what its worth, anyone want to buy it? I'll take best offer I guess-you dismantle & haul. Located in London, KY about 10 miles west of I-75, exit 41.

What is it worth?

Any offers?

Call 606-877-9912 or email to kopy@hughes.net if interested

It can not be galvanized aluminum. If galvanized, it is steel. Anyway, if
it is what is called Rohn 25 and was already down and in good shape, it
would be worth about $ 35 to$ 45 per section, or about $ 160 total. If
someone has to take it down, whatever you can get for it.

If some other type, maybe even less.
Rohn tower has 3 round legs about an inch in diameter and round cross
bracing, about 1/4 inch in diameter that ziz-zags up the sections.

Up here a lot of folks give them away to anyone willing to
dismantle and haul it.away Try to think of it as a liability
lightning rod and maybe kindly give it away to some ham
who would love to have it. The stuff up top may be
worth something to some ham, but you aren't using
it anyways. If you ask around the ham community you
can always find a young ham struggling to better his
station on a shoestring budget.

Message-ID: <Channel.Jumper.9fc8cf8@radiobanter.com>
Source record: 1979

Having worked in the tower industry - not all tower with lattice is automatically Rohn.

There is all different grades of tower, and my guess is that this is TV tower - not the heavy duty Rohn - but I could be wrong.

I also could not blow up the picture to get a closer look - to see if it could be a Rohn 45 series of tower - you never know.

Some things to look at which will distinguish one tower from another, the size of the legs, the width of the legs the bolts that holds it together.

If I am not mistaken Rohn 25 uses two different size hardware - bolts to hold it together.

Some TV towers do not - even if it has lattice - it always isn't ROHN...

http://www.rohnnet.com/rohn-25g-tower

Just as you cannot appraise a automobile or a house or a piece of property over the internet - so too you can't appraise tower.

Two rules of thumb - if the exterior is pitted - it is no good.
If the interior has rust it is no good.

Unfortunately I don't take my own advice.

The last 200' of tower I bought I paid $10 per a 10' section.

I also bought 36' of TV tower for $10.00 a section, and by the time I got it cleaned up and painted, I had $100 into each section.

That is usually the going price - unless someone wants it bad enough to pay more.

Most times most building permits will not allow you to put one up - due to building codes and covenants -and unless you are a licensed amateur radio operator and even then, 40' is probably as high as they will permit you to go - unless you live out on a farm someplace and own lot's of land.

1213. How calculate antenna impedance?

Newsgroup: rec.radio.amateur.antenna
Date: 2012-05-19 02:55:38 UTC
From: mcalhoun@sdf.lNoOnSePsAtMar.org
Message-ID: <jp723a$r8d$1@odin.sdf-eu.org>
Source record: 1980

I've been playing with several programs (tunehalf.exe, endfeed.exe,
and EZNEC). All ask these questions:
* Height of vertical portion of wire
* Length of horizontal portion of wire
* Wire diameter
* Frequency

Endfeed.exe also asks these questions:
* Number, length, & diameter of buried radial wires
* Length of strap from radio to radial connection

Tunehalf also asks these questions:
* Transmitter output impedance
* Length * diameter of coil
* Parallel and serial capacitance
* Estimated ground loss resistance

Among other things, both calculate the antenna impedance.

HOW DO THEY DO THIS? I'd like to write some programs of my own.
What is the formula or equation for estimating/calculating antenna
impedance given the above inputs?

You are far off, there is no single formula or equation.
All the advanced software programs split the antenna structure
into small parts, calculate each part separately and then
put the result together. The current in each small element
generates a field and all those split up parts interact
with the rest of the structure.
There is a name for that procedure:
http://en.wikipedia.org/wiki/Finite_element_method

In the antenna software this is called modelling.
http://www.k5sld.com/presentations/may-2009/EZNEC-basics.pdf
The antennas are put together as small pieces of wires.

Older softwares as e.g. YAGICAD use complete formulas
which give only an approximation value of the real results.
But beware: the formula for the field of a dipole is about
half a page long and is still imprecise.

w.

The Telegrapher's Equation can be used to give an *estimate* of antenna feedpoint impedance for a center-fed dipole if one knows the loss factor which includes radiation. The feedpoint impedance of a center-fed dipole is:

(Vfor+Vref)/(Ifor+Iref)

where all math is phasor math. The Z0 of a center-fed dipole can be *estimated* from the single-wire transmission line formula. For instance, The Z0 for a #14 wire horizontal at 30' above ground is very close to 600 ohms and the SWR on a 1/2WL dipole (including is ~20:1 in order to obtain a 50 ohm feedpoint impedance (which includes end effects). For the length of time it takes the key-down signal to travel the length of the dipole and back to the feedpoint from the open ends, the antenna exhibits a feedpoint impedance of approximately 600 ohms - similar to a traveling wave antenna. The loss factor, including radiation "loss", can be simulated using resistance wire.

Isaac Newton is credited with saying, "If I have seen further it is by
standing on the shoulders of giants."

Duplicating the work of those who have gone before may be only an
entertaining exercise. (I got 1 credit in college for a Physics lab, in
which I confirmed the results of experiments first performed centuries ago.
Frankly, I felt a little silly doing it.)

If you're after an entertaining exercise, more power to you. (I've
"created" computer programs that I knew existed.)

Whilst trying to source a "digital" TV antenna I came across some with all external surfaces plastic. One was a small yagi with all external surfaces plastic, hopefully with metal elements embedded. Another a "T" shape made out of plastic conduit with elements inside conduit.
My question is how do they work?. If they are detecting electrical fields how does increasing source impedance by 100,s of megohms improve things?. Capacitive coupling, I suppose at the frequencies involved there would be some.
If it works as well as all metal why doesn,t every one use it and stop corrosion?
Hope this is not too off topic.
Many thanks
John

I'll bite.

Look up Yagi. Mr Yagi was an English speaking Japanese graduate student
who happened to study antennas in the 1930's under Professor Uda. Unfortunatly
for him and history Prof. Uda did not write English, so he left documenting
to the world his discoveries, and they have since been know as Yagi antennas.

His discovery was that if you take an antenna, say a dipole, and place another
element in the correct position, it adds directionality to the antenna. This
reduces its ability to receive signals in all directions and increases its
ability to receive them in others.

(simplifed explanation follows)

Research has since shown that a slightly larger element, not connected to the
antenna, acts as a reflector and increases directionality in the opposite
direction, i.e. it becomes the back of the antenna.

A slightly smaller element, also not connected in the right place acts as
a director, causing more restriction and more gain in its direction.

You get better results by adding directors than reflectors.

While the size of the actual antenna element effects the frequency response
of the element, (wider elememnts, wider bandwidth), in most cases, it does
not matter how big the reflectors and directors are, only their length and
position matter.

TV antennas are unusal in that they require a very wide bandwith and other
designs such as log-periodic antennas are common, but Yagi designs are used
for single channel, or single band antennas.

So for example, if you wanted to receive all the stations in one direction,
you would use a wideband antenna, if you wanted to receive one partictular

station, a Yagi for that frequency would be smaller and cheaper.

One could make an antenna out of a piece of paper, drawing the elements on it with a conductive pen and it would work. You could figure that out, that a UHF TV signal may fit on an 8 1/2 x 11 paper, but a lower fequency one would need more space and bigger elements.

For recepetion, one only has to build an antenna that would survive its location, so for example a UHF antenna made out of a sheet of plastic, or embedded in one would make a good TV antenna near the sea shore.

It would at as a flag in the wind, so it may not be as good a choice as you think. Putting it in your attic, might be a good choice.

Lots of ham radio antennas have been made from a stick of wood as the beam (the center piece), copper tubing for the driven element (the real antenna part) and coat hanger wire for the passive elements.

Geoff.

Pardon? The coating or conduit shouldn't affect the impedance of the
antenna. The radio signal should pass through the plastic and hit the metal
antenna element.

Are these antennas intended for indoor use where the plastic coating is for
decorative effect?
If the antennas are intended for outdoor use then substantial coating or
conduiting will increase the wind loading of the antenna It also needs to be
u/v stable.

Regards, Ian.

wrote:

>Whilst trying to source a "digital" TV antenna

There's no such thing as a digital antenna or HDTV antenna. There's
nothing specific in the construction or design of the antenna that
will make it better or worse for receiving digital or HDTV signals, as
opposed to analog or digital signals. Modulation methods do not
affect antenna performance (unless you're using very wide band
modulation).

>I came across some with all
>external surfaces plastic. One was a small yagi with all external surfaces
>plastic, hopefully with metal elements embedded. Another a "T" shape made
>out of plastic conduit with elements inside conduit.

URL? Picture? Vendor name? Clues? Try not to be so vague.

>My question is how do they work?.

Badly. A "small" antenna always involves some manner of compromise.
It can be bandwidth, gain, efficiency, or all of these.

>If they are detecting electrical fields
>how does increasing source impedance by 100,s of megohms improve things?.

It doesn't improve anything. Antennas much be matched to their loads.
If you're plugging this contrivance into a 75 ohm TV receiver, then
you'll need some means of matching the 100's of Mohms to 75 ohms.
Otherwise, you will have a bad case of mismatch loss. In many cases,
such mismatch loss can be tolerated, but not for VHF/UHF TV.

>Capacitive coupling, I suppose at the frequencies involved there would be
>some.

Oh? There's magic involved. No coax or twinlead cable? It just
capacitively couples the antenna to the receiver. Truly amazing.

> If it works as well as all metal why doesn,t every one use it and stop
>corrosion?

Because I have not clue what "it" is. It "it" a piece of wire shoved
into a soda straw size pipe, an aluminum tubing antenna spray painted
with plastic, or a PCV schedule 40 contrivance with a wire inside?
Please try to be more specific in your descriptions.

>Hope this is not too off topic.

It sucks. No numbers, clue clues, no specifics, nothing new, no
interest, and very little entertainment value.

> Many thanks

One would be sufficient.

>impedance given the above inputs?

If you want to see how a program works, it's often best to go to the
source code. Most of the major programs are user friendly front ends
to the Fortran or C NEC "engine" that actually grinds the numbers.
However, there is a C version of the code available:
<http://5b4az.chronos.org.uk/pages/nec2.html>
<http://www.si-list.net/NEC_Archives/nec2c.tar.gz>
There are other source code versions that might help:
<http://www.si-list.net/swindex.html>
<http://www.qsl.net/m5aiq/nec.html>
etc...

Yes. The frequency do the work.

Rob wrote: "Apparently you have missed the interesting discussions with our
Polish
friend."

It was not the discussion. I only citate the Giants:
"In 1867 Lorenz wrote: " Ludvig Valentin Lorenz, "On the identity of the
vibrations of light with
electrical currents," Philosophical Magazine, Vol. 34, 1867, p. 287-301"

http://books.google.pl/books?id=caJdQfAKHtMC&hl=pl&pg=RA1-PA287#v=onepage&q&f=false

On p. 301 he wrote:
"The present general opinion regards light as consisting of backward and
forward motions of particles of aether."
If this were the case the electrical current would be the progressive motion
of the aether in the direction of the electrical current."

In today's words: "Light is the oscillatory flow of electrons".

So no problem for electrons to flow through the plastic if it is matched to
the frequencies.
For example,You must use the different type of glass for different wave
length.

The ice is O.K. for the RF but the water not.

I believe he said plastic, not glass or ice.

Is your theory that if you repeat the same garbage over and over,
eventually someone will believe it?

I might as well be part of the problem, instead of the solution.
Adding to your electron belching antenna theory, such antennas should
gain and lose mass as they transmit and receive electrons. If we have
(for example), an antenna with 1A of RF current, that's equal to 1
coulomb/second. 1 coulomb is:
6.24x10^18 electrons
which should be belching:
9.11*10^-29 g/electron * 6.25*10^18 coulombs/sec
= 5.69*10^-9 grams/sec
If your bogus theory is correct, you should be able to weigh your
antenna and see it loses some mass in transmit, and gains some in
receive.

Garbage in, Science out.

Many thanks for your time Gents, The antennas were intended for outdoor use
and constant handling. being encased in hard plastic obviously enhances
those functions. My experience has been at the other end of the spectrum so
to speak and I (incorrectly) assumed an antenna picks up an electrical
signal. Putting a layer of insulating plastic on it seemed contradictory. If
antenna is detecting magnetic signals obviously a different story.
When I mentioned impedance I mislead you. Wasnt referring to antenna
impedance but the impedance looking back form the recieving antenna to the
signal source (thats what us old analogue designers do, Norton/Thevenin
equivalent circuits etc !!!!) and the effect on that a layer of plastic
has.
Your combined efforts have answered a lot of my questions, thanks for your
time.
Cheers

Note that it reads "... The PRESENT general OPINION ...". That was in 1867
and was an opinion so presumably it was neither a theory nor a proven fact.
We have the benefit of research made over the intervening 145 years.

It is probably unwise to quote from books / articles / papers if you do not
understand them.

The key phrase here is "usually idealized"; there are many examples of
systems that don't have anything that could even remotely be considered
a "ground".

> All antennas are grounded

Totally false.

You are a babbling idiot.

What does this have to do with measuring the weight change in an
antenna that allegedly is transmitting electrons? Electrons have
mass. Transmit enough of them and you'll loose mass. Receive enough
electrons, and your mythical antenna should gain mass.

Also, if the earth is absorbing your electrons, something should be
gaining a rather large positive charge as a result of the
transmission. Where is the positive charge?

While we're at it, there are many ways to detect electrons. One of
them is with a phosophor screen, that will light up when hit by
electrons. Some how, waving my HT near the phosphor screen of my
oscilloscope fails to detect your alleged electrons. Could you
perhaps offer a better way to detect the electrons allegedly radiating
from an antenna?

>All antennas are grounded and you should be able to weigh the Earth because
>it gain and lose mass as they transmit and receive electrons"

I see. If I'm standing on the ground, I can't be weighed. Well, my
bathroom scale is sitting on the ground and works just fine measuring
my weight.

My HT antenna isn't grounded. Neither are any of the dipoles on my
roof. I presume you're suggesting that they don't work.

Now, that we have the requisite science fiction out of the way, could
I trouble you to answer my original question.
Is your theory that if you repeat the same garbage over and over,
eventually someone will believe it?

The Earth is in space and the spacecraft also.
The same is with aircrafts and autos.

All transmitters and receivers are connected with the mass.

Radio transmitter is an electron pump.
But without the "infinite source or sink for charge" it do not work.
>
> Also, if the earth is absorbing your electrons, something should be

Without the "infinite source or sink for charge" a transmitter is gaining a
rather large positive charge.

It is a pity that you are not a radio amateur yourself.
If so, you could see with your own eyes (or feel with your own hands)
that this is not true, and so the whole theory is incorrect.

But maybe you have a cellphone. Try making a long call while you stand
on one of those glass tables that they use in static electricity
experiments.
See if you develop a positive charge while making that call.
(and not doing other things like stroking your cat)

Mine aren't.

The way you talk about radio reminds me of a friend who used crystal sets
back in the 1920s. Fortunately, hew was able to learn modern radio theory
and practise.

I've a recollection that you've posted your views onto this newsgroup a few
weeks ago.
I guess that asking you to disregard 19th century understanding and learn
20th and 21st century understanding is probably an unproductive approach.

Regards, Ian.

With a Hand Held Radio - the person holding the transceiver is the ground plane. Because the human body is comprised mainly of water, it acts like the missing half of the antenna.
Radio waves in front of the person is radiated, radio waves behind the person is blocked to a small extent because of the water in the persons body.
This is the reason why Rabbit Ears antenna's do not work in concrete apartment buildings with people moving around the room.

The person who is walking around blocks some of the reception - especially in the higher frequency ranges because anything one or more wavelengths in size can and will block a signal.

I'm surprised that no one caugth the foopaugh that the origional answer giver had made when he described how a antenna works.

The reflector has to be a certain size for a certain wavelength and there is only one driven element.
The other elements - also known as directors - gathers the signal and directs them backwards in the array towards the reflector.
Each director gathers the same amount of signal as a dipole and each director adds gain to the antenna at the expense of beam width.

The only way to increase gain is to give up something somewhere else.

If you stack two antenna's one above the other - one wavelength apart - and build phasing lines, each antenna will only agument the other by a gain factor of 2.85 - reguardless of how much gain the origional antenna had.

If you stack two beam antenna's, one or more wavelengths apart - the apature becomes smaller - hence if you put enough of them together, it is as if you were trying to look through a straw while driving an automobile.

The beam width becomes very narrow, while increasing forward gain to the point of infany.

With a UHF signal - eventually when it runs out of things to bounce off of - it just travels in a straight line - out into space, never to be recovered again.

I think the OP was asking about receiving antenna's and not transmitting antenna's.

A receiving antenna - works best when it is cut to one individual frequency, but those antenna's tends to be more expensive, not less, because they have to be purpose built. The size and spacing has to be more exact to get the results the buyer is looking for.

While a VHF antenna, with the use of phasing lines, a person can make a very broadbanded antenna and it will still work up to the length of the longest combined element.
When the elements are too long, the antenna can look back through the array and can match the wavelength to the elements in the array...

Prove it. Show me a way you can detect your mythical electrons coming
off the antenna. Or better yet, explain to me why common methods of
detecting electrons (fluorescence, phosphorescence, Wilson cloud
chamber, electrometer, electroscope, etc) fail to detect your mythical
electrons.

>But without the "infinite source or sink for charge" it do not work.

How large is infinite? Does that mean that radio only works when I
can't measure it?

>Without the "infinite source or sink for charge" a transmitter is gaining a
>rather large positive charge.

Amazing. I put my voltmeter on the case of my HT, and there's no DC
voltage when transmitting. Same with various HF transmitters. Perhaps
my radio is not infinite enough.

>Tesla made the electron beam and next the X-rays.

Electron beams (cathode rays) were discovered by Johann Hittorf in
1869.
<http://en.wikipedia.org/wiki/Cathode_ray>
X-rays were correctly described by Wilhelm Rï¿½ntgen in 1895.
<http://en.wikipedia.org/wiki/X-ray>
Please have you history recalibrated.

>They are connected to the mass (chassis).

Where is the chassis on my HT, TV antenna, dipole, satellite antenna,
and other antennas that are not grounded? They seem to work equally
well with metallic, insulating, and unsupported mounting arrangements.
Also, without I ground, I presume aircraft communications also does
not work?

>> Now, that we have the requisite science fiction out of the way, could

>> Is your theory that if you repeat the same garbage over and over,
>> eventually someone will believe it?
>
>It is theory of Faraday, Lorenz, Marconi, Tesla and Dirac.

Some of their early guesses were wrong. It was bad enough that when Lee De Forest had to defend his patents in court, he could not explain how they worked. I don't care if your theory came directly from the radio gods themselves. If your theory cannot stand up to simple scrutiny and real world examples, then it's garbage, no matter from where you excavated it.

Anyway, you didn't answer my question (3rd try). Do you believe that repeating the same wrong theory over and over will somehow make it correct? Or perhaps your plan is to wear everyone down with your one line incorrect and unsubstantiated claims, in the hope that we will become tired of your games and go away? Or, are you simply craving for attention?

>Who is the authors of yours?

I haven't presented a theory. I've only shot holes in your theory. I don't need the testimony of dead scientists to demonstrate that an ungrounded antenna still functions and that antennas do not belch electons.

Incidentally, if you had a clue, which you apparently do not, you might read up on photons, which are the carriers of electromagnetic force, including RF.

The earth and spacecraft are floating around in a vacuum, same as
between your ears. I think you'll find it rather difficult to
demonstrate a conduction path through a vacuum for your grounded
antenna theory. Besides, if outer space did provide a conduction
path, it would also short out the antenna elements.

>The same is with aircrafts and autos.

Aircraft and autos do not operate in outer space.

>All transmitters and receivers are connected with the mass.

What mass of outer space? There is roughly 1 hydrogen atom per cubic
centimeter in outer space. That's not much mass and certainly not
enough to ionize and produce a conductive path.

Not quite right, since you don't have to actually "block" the signal for
it to happen, but Mr. Blaupunkt wouldn't have a clue anyway. It's more
about the whole wavefront, amplitude of the parts of same, phase, and
interaction with the surrounding conductive and absorptive environment.
Some of which can be alive, filled with salt water, and move.

I liked the reflector screen on the HW-DT8. It's appears just a bit
sparse for the frequencies it's supposed to cover.

Other than that the driven part is kind of interesting. If it's
reasonably priced enough and shipping isn't out of line I may order one
just to see what mischief they are up to.

tom
K0TAR

Link to the antenna I referenced.

http://www.happywanderer.net.au/page.asp?parentid=19&parent2id=71

And of course it will give me a nice new antenna to perform weight and
charge measurements on.

Can't use an old one. See, when the antenna gets used more and more it
gets tired because of electron loss. You have to watch your transmit
and receive balance. If you don't you will end up with too few
electrons around, which makes for an increase in transmit resistance.
Some people think it's impedance, but they don't know it's just because
you haven't got the right length coax.

And the other way around, if you receive all the time you eventually
fill the electron sump, and the antenna must be discarded unless you can
get a good electron sump pump for cheap. Funny thing, that's why the
old AM and FM radios wore out - they were full.

Because I'm terrible at resisting temptation. If someone wants to
make themselves a target, it's far too tempting to take a few shots at
the target. Also, I enjoy reading (and writing) science fiction.
However, the real reason is that I haven't seen any decent antenna
related discussions in this newsgroup for a long time.

Its why you should never leave a powerpoint switched on. You end up with a heap of electrons on the floor.
And a hole under the neutral hole.

Unfortunately the clueless idiot from Poland has woken up and is
making his outdated claims again...

What you should know is (and apparently have realized by now) that
the antenna impedance is not an impedance between its elements and
the surrounding air, but a "radiation impedance" that results from
the antenna emitting an electromagnetic field. This field traverses
plastic, a vacuum, air etc without problem so it does not matter if
you coat the elements.

A cristal sets has the modern name "rectenna":
"A simple rectenna element consists of a dipole antenna with a diode connected across the dipole elements. The diode rectifies the AC current induced in the antenna by the microwaves, to produce DC power, which powers a load connected across the diode. Z: http://en.wikipedia.org/wiki/Rectenna

There no contradictions:
"In April 1887, Tesla began investigating what would later be called X-rays

using his own single terminal vacuum tubes (similar to his patent #514,170). This device differed from other early X-ray tubes in that it had no target electrode. The modern term for the phenomenon produced by this device is bremsstrahlung (or braking radiation). It is now known that this device operated by emitting electrons from the single electrode through a combination of field electron emission and thermionic emission. Once liberated, electrons are strongly repelled by the high electric field near the electrode during negative voltage peaks from the oscillating HV output of the Tesla Coil, generating X rays as they collide with the glass envelope. He also used Geissler tubes. By 1892, Tesla became aware of the skin damage that Wilhelm R&#65533;ntgen later identified as an effect of X rays."

No, they did not.

Today we know that SOME types of antennas work better if grounded and that there are no electrons gained or lost from antennas.

You are a babbling fool.

I don't recall us having nuclear bombs in the 19th century, nor transistors nor integrated circuits. The underlying physics may not have changed but man's understanding of it certainly has.
By analogy, the human body is still the same design as it was in the 15th / 16th /17th centuries (and earlier and later). If you need a doctor, will you go to one practising 21st century medicine or 15th century medicine?
Would you prefer to drive a 21st century car or a 19th century car? Would you be worried about dropping off the flat earth?
Perhaps you should study the "phlogiston" theory. How about the opposition that Galileo encountered when he tried to support the theory of Copernicus that Earth orbits around the Sun? If you'd been around in the time of Galileo and Copernicus I guess you'd be certain that the Sun orbits the Earth. After all, that's how Ptolemy said it was and that view lasted a thousand years or more.

Regards, Ian.

Ah no, Marconi showed that HIS antenna worked better when connected to ground. He definitely did not prove that all antenna must be grounded because many antennas in common use to-day (for example the quad and the yagi) weren't invented until long after Marconi's experiments.
Several people have told you the same thing. Some of those people hold amateur radio licences and will have built and operated antenna which definitely are not connected to ground so they'll know what works.

Any truth in the rumour that you live in the central USA and hold an Extra Class licence?

Regards, Ian.

Well, with Field Day coming up, I had planned to use last year's 20m dipole again, but I was on the phone with a guy last night and he dictated some really easy-sounding plans for a two-element quad. It's supposed to be good for 6 dB more gain than a dipole. Yes please, I'll take one free S-unit. We're in the southwest corner of the country, so aiming it is a no-brainer.

Maybe I can post a diary of the build to amuse you nice folks by demonstrating my (lack of) skill using hand tools. By the way, we'll be using N3FJP's "Field Day Network Logger" this year, for the first time. Last year, one of our guys used N3FJP single-station logger for himself (400+ contacts) and he registered the network version for the club. I like it. We've had several good trial runs. Find it at http://www.n3fjp.com/.

Hello courteous, dedicated and hard-working (over-worked) Sal.

After that write-up you may get a posting from a certain person telling you to use a 19th century antenna rather than a modern one. So much better for throwing those electrons into the aether :-)

I'd be delighted to read your diary. Your hard work will save my hands from Bandaids and other first-aid treatments. I like to learn through other's pain. Actually, a two-element quad might be a project for 2013 for me - not sure if my yagi is still fit for work on 20m - 15m - 10m. Homebrew quads used to be popular here in the UK some decades ago.

73, Ian.

It is probably what is called a "folded dipole."

We used to make them out of common TV twinlead. They have a characterisstic impedance around 300 ohms, same as the twinlead, so the black block at the hub is likely to be a 300-75-ohm balun (trannsformer) to match the coaxial cable lead-in.

You determine the frequency of interest and cut it to size, accordingly. They're not too great for wide-band coverage, but you might get lucky. (The wide-band issue is why big, expensive antennas always have elements of many different sizes. "One Size Fits All" definitely does NOT apply to antennas.

>We're in the southwest corner of the country, so aiming it is a no-brainer.

Much better. Field Day is the prime incentive to do last minute
repairs on antennas and equipment. It's also a great place to do
testing that should have been performed before Field Day. Learn by
Destroying at its best. While fatalities and major injuries tend to
be minimal, I can't say the same for equipment and antenna failures.
Somehow, the miracle antenna contrived specifically for Field Day just
doesn't seem to tune or work as expected. Your "easy-sounding plans"
should be an ominous warning of problems to follow.

I'm staying out of Field Day this year. I had planned to deploy my
inflatable antenna design, but decided that doing R&D on top of a
mountain was not a good idea. I plan to visit, but not operate much.
I did my part this morning by customizing one of the Field Day
trailers with my cutting torch. Hopefully, I didn't weaken the
structure so that it will collapse on arrival to the site.

>Maybe I can post a diary of the build to amuse you nice folks by
>demonstrating my (lack of) skill using hand tools.

Any tool can be used as a hammer. That should be fun to read, and
more fun to watch the video.

>By the way, we'll be
>using N3FJP's "Field Day Network Logger" this year, for the first time.
>Last year, one of our guys used N3FJP single-station logger for himself
>(400+ contacts) and he registered the network version for the club. I like
>it. We've had several good trial runs. Find it at http://www.n3fjp.com/.

We like to use N1MM, mostly because it's free, but also because it
took the last half dozen Field Days to train the operators in its use.
<http://n1mm.hamdocs.com>
We also gave up on running CAT5e all over the site because of the RFI
generated, but also because I got tired of dealing with trashed rolls
of CAT5e as everyone seem to enjoy walking on or tripping over the

CAT5 and coax cables. We tried 802.11g wi-fi, but found that high
power transmitters are really good at blocking the receiver front end
of the wireless cards. Since we don't run more than one station on a
band, there's no issue with dupes. So, no network needed.

>(Jeez -- what am I _not_ doing?)

Operating?

Not quite totally plastic. Inside the ABS or PVC tubing are some
wires. Most likely, a length of twinlead forming a folded dipole.
While not the most sophisticated antenna available, it's probably
sufficient for campers and caravans.

However, there's a small problem. If you cram an antenna into a PVC
tube, the resonant frequency goes down. There's no set value for the
velocity factor for PVC or ABS, so the resonance change will vary with
manufacturer, doping, and the position of the moon. It's not a big
deal for a low-Q minimal gain and wide band antenna such as this
folded dipole. However, as the gain goes up, the tolerances for
element lengths become more critical. This means that changes in
effective length and resonance caused by PVC or ABS pipe becomes an
important consideration.

The distance between the metal elements and the dielectric (PVC or
ABS) is also a consideration. Obviously, if the pipe diameter were
fairly large, the effect of the pipe would be minimal. Similarly, if
the pipe were molded around the conductor, the effect of the pipe
would be maximum.

There's nothing magic about coating an antenna to prevent corrosion.
This is an important consideration for trailers, campers, and
caravans. The antenna has to survive freeway speeds and be fairly
aerodynamic. Coating the antenna with smooth plastic does this.

If you feel ambitious, and happen to have either a grid dip meter or an antenna analyzer, just build any resonant antenna (probably at VHF frequencies) and watch the resonant frequency change as a PVC or ABS pipe is slid over the antenna elements. I build a collinear antenna out of alternating pieces of coax cable. It tuned perfectly, until I slid the antenna into a PVC pipe. Tuning changed from 146MHz to a useless 135MHz. Filling the pipe with urethane foam (fence post compound), lowered the frequency a few more mHz.

Sound warning, indeed. I checked some websites devoted to quads and the measurements are in the ballpark. The 20m version is fairly close to the ground,, being suspended from a boom at the top of a 30-foot pole. I'm going to build it and try it in my yard before taking it to FD. The 30-foot pole is no problem; I had three of them last year for the dipole.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

Galileo, Copernicus, Ptolemy. All known that the planets orbit the Sun.
But the teaching program "said" the "the Sun orbits the Earth."

The same is now.
All physics people know that : "Light is the oscillatory flow of
electrons".
But in teaching program are mystery TEM waves.

Did you read the final comment - "I am afraid that Peter Stuart has been misled. There is not the slightest chance of "tapping in" to the power being radiated even from the highest power stations". That came from someone who ran high power transmitters.

How much power input or output does a transmitter have to have in order for it to be a "powerful" transmitter? I have a 400W transmitter around six miles away and a 200kW transmitter around 50 miles away. Which one's signal will be the stronger at my house?

How accurate are science based reports in the Telegraph?

"Some people" consider the Fresnel's idea and Heaviside's equations as
authoritative.

"" In 1817, Young had proposed a small transverse component to light, while
yet retaining a far larger longitudinal component. Fresnel, by the year
1821, was able to show via mathematical methods that polarization could be
explained only if light was entirely transverse, with no longitudinal
vibration whatsoever.
From: http://en.wikipedia.org/wiki/Fresnel

But some people know that Young is right and that: ""Light is the
oscillatory flow of electrons".

This small transverse component is because the light is radiated by dipole.
Radio waves radiated from monopole are the pressure waves (oscillatory
flow).

And what is your opinion about Wiki:
"It is now known that this device
operated by emitting electrons from the single electrode through a
combination of field electron emission and thermionic emission. Once
liberated, electrons are strongly repelled by the high electric field near
the electrode during negative voltage peaks from the oscillating HV output".
From: http://en.wikipedia.org/?title=Nikola_Tesla

I hope that you accept the word "electrode" in place of "antenna's end"

Do you want to claim that the kind of waves radiated from a transmitter
antenna varies depending on the type of antenna?

So that a dipole antenna produces another kind of wave than a monopole
antenna?

It should then be possible to determine at a distance what kind of
antenna was used to transmit the wave. Can you describe an experiment
to do this determination?

Faraday wrote in 1846 that to have the polarized waves you must use the two
or more sources.

To have the linear polarization we are using the dipole.
To have the circular polarization we are using the two dipoles.

The above is easy to "determine at a distance what kind of antenna was used
to transmit the wave."

But is the another phenomenon. The Luxembourg effect.
The dipole radiate the doubled frequency.

Once again our resident babbling idiot takes a snippet of something from
Wiki totally out of context, and misinterprets it.

It has been explained to you several times that any electron emmission
from the ends of an antenna is an abnormal situation, is NOT required
for antenna operation, and is an independant phenomena of normal antenna
operation.

It has also been explained to you several times that there are types
of antennas where this never happens.

Yet you keep babbling on like the totally ignorant idiot you are.

Ah yes - the famous "is it a dipole or is it a dipole?" test. Of course, it
wouldn't discriminate between a dipole and a yagi (staggered or phased?)

Luxembourg effect? Harmonics?

My guess is that the quote from Wiki relates to vacuum tubes. Ah yes, it does. Shall we put the farmer's barn into a large vacuum?

As I said ...

Did you read the final comment - "I am afraid that Peter Stuart has been misled. There is not the slightest chance of "tapping in" to the power being radiated even from the highest power stations". That came from someone who ran high power transmitters.

How much power input or output does a transmitter have to have in order for it to be a "powerful" transmitter? I have a 400W transmitter around six miles away and a 200kW transmitter around 50 miles away. Which one's signal will be the stronger at my house?

How accurate are science based reports in the Telegraph?

Nothing invented in the 20th century? Nuclear weapons, the Internet, String Theory? Ptolemy chose the earth centric model. Copernicus disproved it and developed the sun centric model. Galileo was somewhat unpopular with the church for supporting the earth centric model.

And after 166 have passed, we know that is not correct.

> To have the linear polarization we are using the dipole.
> To have the circular polarization we are using the two dipoles.

To have circular polarization, we also use helical antennas, something
that didn't exist 166 years ago.

We also have various types of loop, dielectric and waveguide based antennas,
such as the slot antenna, that did not exist 166 years ago.

> The above is easy to "determine at a distance what kind of antenna was used

No, it is not, in fact it is impossible to do.

> But is the another phenomenon. The Luxembourg effect.
> The dipole radiate the doubled frequency.

The Luxemburg-Gorky effect, which is the real name, has nothing to do
with antennas.

This is just more of your babbling idiocy.

> Regards, Ian.

I share your skepticism, Ian, and I'd like to take it a step further.

There is real math (imagine that!) to address the notion of "stealing power
from a nearby transmitter." Free-space attenuation is given by the formula
20 log Rf + 37dB, where R is the range in Nautical Miles and f is the
frequency in MHz.

True, a close-in VLF transmitter gives good coupling and actually will light
an unconnected fluorescent tube. However, these stations are quite rare and

nobody moves near them to "steal power," since they are built in large open areas with fences and guards. Need backup plan.

Next best bet: Get within 500 feet of a 50KW AM station, say KFI, AM-640 or KBOI, AM-670. Per the formula, the coupling loss will be about 13 dB, making 2500 watts of power available to you at that location. However, to realize that power, you need an antenna with near unity gain at that frequency. Any guesses as to how much they cost? Try $Millions. (It's called a 600-foot tower.) Much better to call your local utility and tell them how much you appreciate their service. Resolve to be more realistic about power-robbing schemes.

COMING NEXT ON THE POWER ROBBER CHANNEL: Tap into your neighbor's garden lights -- it's easy!

73,
"Sal"

Hello Sal. Thank you very much for the maths and the workings. Stories of "getting useable power from a transmitter" are always hard to track to an accurate source. The nearst I've gotten is a friend who knew of a cottage with a 33kV power line passing overhead. Seems that some turns of wire were fitted under the cottage's eaves and some useful power was obtained. Transfoemer action, I assume.
I've read science fiction stories form the 1930s where "broadcast power" was in general use. One story had all users switch off their powere receivers so that the authorities could D/F a wanted person by measuring the strength of the power field. Ah - unfettered imagination though induction does work when the power source and appliance are close together.

73, Ian.

The commercial power in my neighborhood has an asymmetric waveform. Some of us have been saving the extra electrons on one-half-cycle. We had a power outage in October of last year and what we're saving now will be used if we ever suffer another outage.

The extra electrons flow into the ground. Like in your radios.

Fundamentals of radio.

>Ptolemy chose the earth centric model.

Today astronomers do the same. The Sun is too hot to make the measurements
from it.

>Copernicus disproved it and developed the sun centric model. Galileo was
>somewhat unpopular with the church for supporting the earth centric model.

Copernicus and Galileo were trying to change the teaching program.

The same is now.
It is time to replace the EM by Heaviside with Ampere electrodynamics.

Harmonics are in string, plate, piano box etc.

Pendelum and LC circuit have the one frequency only.

LW from the dipole mast were (and are) received on MW receivers at exactly doubled frequency.

Yup. Harmonics. The Luxembourg effect was cross-modulation. I'd completely
forgotten about it.

Was it a dipole or was it a dipole?

I beg to differ and hair split. The free space attenuation formula
works nicely at a distance of about 1 wavelength or more away from the
antenna. However, at the broadcast band wavelength of about 300
meters (about 1000ft), any attempt to steal power will probably
require near field calculations, or perhaps just transformer action.
<http://en.wikipedia.org/wiki/Near_and_far_field>

>Next best bet: Get within 500 feet of a 50KW AM station, say KFI, AM-640 or
>KBOI, AM-670.

RF safety exposure limits at 500ft for a 50KW AM station and 0dBi
antenna gain, yields about 1.5 mw/cm2. The safe limit is 100mw/cm2.
<http://kb9mwr.dyndns.org/n9zia/rfsafety.main.cgi>
Therefore, it is safe to approach the antenna without fear of having
your brain morph into Mr. Bialek. At about 60ft is becomes officially
unsafe.

>Per the formula, the coupling loss will be about 13 dB,

>about power-robbing schemes.

Technology to the rescue. Once upon a time in the 1960's, I lived in
Smog Angeles and worked part time next to an AM station. Surrounding
the antenna was the requisite chain link security fence, which had
several gaps in the fence for access gates. If one of the gates was
left open, forming a 1 turn coil, I could draw a small arc across the
gap with a clip lead. I wanted to fake an electrocution by bridging a
gate with both arms, but chickened out. When the station personnel
found out what us juvenile delinquents were doing, they promptly
buried a wire across each gate to short out the gaps, and changed the
locks on the gates.

Incidentally, locating the Gertsch/Singer (manufacturer of
communications service monitors) factory next to an AM broadcast

station (I forgot the call sign) in LA was not a great idea.

>COMING NEXT ON THE POWER ROBBER CHANNEL: Tap into your neighbor's garden
>lights -- it's easy!

Yech... The next revolution in home alternative energy will be the nuclear powered underground water heater and the solar powered steam plant. Dispose of hot nuclear waste and run your water heater at the same time. If you do the math, solar steam power is cheaper and more efficient than solar cells.

Somewhat more seriously, I've been reading about nantennas for solar power. With 85% theoretical efficiency, it sure looks promising.
<http://en.wikipedia.org/wiki/Nantenna>
<http://www.inl.gov/pdfs/nantenna.pdf>
Maybe there's a place for RF engineers in alternative energy. All I need to do is build a 3,000GHz antenna farm and find a diode that works at that frequency.

Oh dear - no. Astronomers to-day know that the earth orbits around the sun.
It is incorrect to say that "the sun is too hot to make the measurements".
Scientists make plenty of observations of the sun (sunspots, CME and so on).

Regards, Ian.

The principle of nantenas is the same as the crystal radio.
The size of the antenna must be below 1/2 WL.

For RF each diode is O.K.

The question is if the electrons flow into the ground.

Do you know the answer?

It is an explanation.
The Luxembourg effect WAS the receiving of LW from Luxembourg mast on the MW
receivers tuned to the doubled frequency..

All measurements were, are, and will be done from the Earth.

"Ptolemy chose the earth centric model" means that all measurements must be done from the Earth.
All astronomers before Ptolemy (and he) known that the planets orbit the Sun.

Please read the PDF I included. The length of the dipole can be any
multiple of 1/2 wavelength. It can also be a loop antenna. What's
critical is the spacing between the antenna and the underlying ground
plane, which form a resonant cavity at optical frequencies.

>For RF each diode is O.K.

Please read the Wikipedia article:
The large loss in power is a result of the junction
capacitance (also known as parasitic capacitance) found
in p-n junction diodes and Schottky diodes, which can
only operate effectively at frequencies less than 5 THz.[3]
The ideal wavelengths of 0.4-1.6 um correspond to
frequencies of approximately 190-750 THz, which is much
larger than the capabilities of typical diodes. etc...
This isn't going to work with ordinary diodes.

>The question is if the electrons flow into the ground.

Nope. The question is whether there are any electrons involved. There
are none.

>Do you know the answer?

Yes... I know everything. If you unable to form a suitable opinion, I
would be happy to supply one for you.

Everyone constantly repeating that there are no electrons falling to
the ground or spewn into the air doesn't seem to have much of an
effect on you. You are also apparently incapable of answering my
question (multiple times). I see no indication that you have read,
much less understand, any of the references and explanations supplied
for your benefit. You are therefore hopeless and a waste of time.

"The electrical grid, which is normally three-phase AC, can be severely disrupted by the presence of a large DC bias. This is caused by strong solar flares hitting the Earth's atmosphere,(Even pipelines, such as the mostly above-groundAlaska Pipeline, are prone to this, and must be tied to electrical ground".

Now you are only one. Two days ago Jimp wrote:
"It has been explained to you several times that any electron emmission from the ends of an antenna is an abnormal situation, is NOT required for antenna operation, and is an independant phenomena of normal antenna operation."

So we have done the first step: "electrons falling to the ground or spewn into the air" are the abnormal situations".

The next step will be "L. Lorenz is right".

The electrical grid has nothing to do with antennas and the structures
being discussed are usually miles long in size.

There are no antennas miles long in size.

No, we do not.

Even in a solar flare there are no "electrons falling to the ground or
spewn into the air".

Solar flare effects at ground level are magnetic effects.

And like many of your other ancient references, it was wrong.

There is no relationship to the frequencies.

> Is the cross modulation if the LW are from the monopole antenna?

Cross modulation has absolutely nothing to do with antennas.

It is an effect caused by a perturbed region of the ionosphere far from
the antennas.

You are a babbling idiot.

"In 1933, Radio Luxembourg opened a 200 kW long wave transmitter,
broadcasting in English from the Grand Duchy in the afternoons and
evenings."
From: http://frequencyfinder.org.uk/trans_hist1.html

It was a dipole mast. The same was in Warsaw . The same effect was observed
(the LW were received on radio set as MW).
Now is a 1/4 WL mast and no the effect.

And the LW station caused cross modulation of a MW station, resulting
in the LW station being heard at the same time as the MW station on
the MW station frequency.

> It was a dipole mast. The same was in Warsaw . The same effect was observed
> (the LW were received on radio set as MW).

Incoherent, meaningles babble.

The Luxembourg effect has nothing to do with antennas and happens in the
ionosphere.

Thanks. There's an all too common misconception that the engergetic
charged particles produced by solar flares, solar storms, solar wind,
CME's, etc somehow land on the power lines, which then appears as a DC
voltage on the lines. That's not how it works at ground level. This
explains it better than I could:

I can almost guarantee our babbling Polish idiot believes that solar
produced particles make it through the atmosphere, which they do not.

All that energetic crap from space winds up being trapped by the air in the
upper atmosphere, ionizing the air from about 85 km to 600 km in altitude,
which is why the ionosphere exists.

It occurs to me I should probably define the term "energetic crap from
space".

What is meant is any particle or EMR with sufficient energy to knock an
electron off of an atom.

For EMR, that starts in the UV region, which is the primary source for the
ionosphere under normal conditions.

During solar flares, there are LOTS of high energy particles being ejected
by the Sun of sufficient energy which add to the mix.

For an off topic amusement:

I did a search for our babbling Polish friend and the first thing I found
was a message posted to a Polish medical list where he claims all cancer
is a fungus and should be treated with Epsom salts.

It appears his idiocy is boundless.

Not me:
I have informed that somebody wrote:
"" I read Dr Simoncini's (oncologist) site at
http://www.curenaturalicancro.com/ that basal cell is a candida fungus, in
fact he claims ALL cancer is a fungus, and he recommended tincture of iodine
2x per day onto the basal cell. I tried that and had a major clearing but
could not get the entire thing removed plus an iodine stain is not exactly
wonderful on your head! I then pursued the candida angle and read that
magnesium sulphate (Epsom Salts) saturated solution in water is deadly to
almost any fungus/yeast. Well, after 1 week of applying this it has sorted
out my basal cell and removed it completely. That stuff is dirt cheap and
works."

Before I have read that J. Schneider used the Epsom salt to cancer cure.

Do you know same examples of using the Epsom salt?

In the teaching program the stationary electron create the electric field.
The same electron during travel create the magnetic field.

So should be obvious for you that if you detect the magnetic field it means
that close to you is the electron flow.
No magnetic field without the electron flow.

In physics "magnetic effects" = electron flow.

If you detect the magnetic field it means that the electrons "land on the
power lines, which then appears as a DC voltage on the lines."

Faraday and Marconi did not go to schools.
Would be better the same for you.

J. Schnieder (GRAB SADDLE) did it. He was using the saturated solution of
Epsom salt +Vit C.
The National Center Institute Found that " it killed melanoma, renal, brain,
ovarian, leukemia, colon, CNS and 2 types of lung cancer".

I had the melanoma and "go with epsom salts." But I was sure that it is a
"modern medical treatment".
Of course the cancer disappeared after two weeks without a scar.

John Schneider discovered the cancer cure and Grab Saddle.

Sorry for the delay, work kicked me for a while.

I finally got back to checking and the noise is louder and when unhooking the tuner (which is attached to the dipole) the noice immediately goes away. Yesterday was about S9 or S10 of constant noice coming over all the bands on the HF.

Is there any good Intermod filter for older style solid state rigs? There must be a cell phone tower or plazma tvs all over my neighborhood. Only way if that is the case to eliminate this is a intermodulation filter of some type on my end.

Any good comments I am appreciative, cheap comments welcome as well.

Does "unhooking the tuner" mean that you've unplugged the antenna lead
from the plasma TV, or that you turned off the plasma TV? If the RFI
is really coming from the antenna connection of the TV, a simple 54MHz
high pass filter should be sufficient to reduce the RF emissions at HF
frequencies to tolerable levels. However, I think turning off the TV
would be better.

>Yesterday was about S9 or S10 of constant noice coming over all the bands on
>the HF.

I was playing with a Heathkit GC-1000 WWV clock a few nights ago.
Reception was horrible and there seemed to be a rather high noise
level. I turned off everything I could think might be the culprit and
the noise was still there. I gave up for the evening. When I turned
off the room lights, the noise went away. One LED lamp turned out to
be the culprit:
<http://www.homedepot.com/webapp/wcs/stores/servlet/ProductDisplay?productId=203088292>
I have 3 of these running, but only one of them generates RFI.

>Is there any good Intermod filter for older style solid state rigs?

There's no such thing as an "intermod filter". Intermod is the result
of mixing two signals. That's not what's happening in your case. It's
just plain old conducted or radiated RFI and EMI.

>There
>must be a cell phone tower

Cell towers do not have anything to do with your noise problem. Cell
towers operate at 700MHz and up. Your HF activities are 2-30MHz.
However, one major (local) source of RFI/EMI are line synced solar
inverters. Most are fairly clean, but some of the older inverters
required line filters, which tended to be an added option rather than
a requirement. If the noise level follows the sun, look for solar
panels on the rooftops.

>or plazma tvs all over my neighborhood.

Yep. Incidentally, we had a little transmitter hunt trying to find
what seemed like an obvious plasma TV noise source. However, when we
turned off the plasma TV, the noise was still there. It was

eventually traced to a nearby "Ionic Breeze Air Purifier" with a very
noisy hi-v power supply. It was exchanged for another under warranty,
which was even noisier.

>Only way
>if that is the case to eliminate this is a intermodulation filter of some
>type on my end.

You can't "eliminate" EMI/RFI on your operating frequency with any
type of filter. You have to eliminate it at the source. You can make
improvements if you can determine the path from the alleged source to
your HF rig. If it's radiated, shielding at the source, moving things
around, and adjusting antennas. If it's conducted, power line
filters, at both ends, will help. Meanwhile, make friends with the
neighbors, convince them to "upgrade" to LED TV's, or adjust your
operating hours to when the plasma TV's tend to be off.

wrote:

>Before I have read that J. Schneider used the Epsom salt to cancer cure.

Well, might as well go further off topic. I'll make it quick and
painless.

In about 2006, I discovered that I had prostate cancer. I had some
time, so I elected watchful waiting, while I shopped around for
alternatives to conventional cancer treatments. I settled on 3 rather
popular treatments and tried them all with religious adherence to
their recommended procedures and strictures. Nothing worked, and my
PSA score continued to climb:
<http://802.11junk.com/jeffl/crud/psa.jpg>
(The big peak in 2007 was from the effects of a kidney stone.) As I
approached meltdown, I finally elected to have my prostate surgically
removed. A year later, I had to go through radiation treatment to
clean up the mess because I had waited a bit too long.

During this exercise, I learned a few things about alternative
medicine and cancer.
1. There are plenty of people that do absolutely nothing and have the
cancer miraculously disappear. It's more common than I suspected. I
know two such people.
2. History is written by the survivors. The failures of any
alternative procedure is unlikely to write a report indicating that
they had died from the procedure. Those that survived, and where the
alternative treatment failed, are unlikely to report the failure. Of
course, the proponents of the alternative treatment are unlikely to
mention failures. The result is the overwhelming number of user
comments on alternative treatment web sites are positive.
3. There are huge number of scams and disreputable medical schemes on
the internet. There are also credible looking research reports, which
offer conclusions not substantiated by any data. Some reports go so
far as to be self-contradictory. I found one that couldn't even get
the arithmetic correct.
4. The way to separate the scams from real research is to determine
if the author has a financial interest in the procedure. If they're
selling a book, potion, drug, procedure, or have a political agenda,
then they should be ignored. What's left are usually government and
university financed studies.
5. Alternative medicine certainly has its benefits. In general, it's
a great way to clean up a bad lifestyle. Living on junk food, not
getting enough exercise, and high stress all have their effects.

However, the price of alternative medicine might be delaying conventional treatment, which often has fatal results. That's roughly what happened to Steve Jobs, who delayed pancreatic cancer surgery a bit too long.

Feel free to try Mr Bialek's recommended treatments. However, have your exit strategy ready in case they fail.

> How about a nice modern compact capacitor?

It should be with the low leakage. The Leyden jar has a thick insulation.
And,

"Any type of capacitor may develop excessive leakage if the capacitor is
subjected to excessive applied voltage or high-voltage spikes."

.It was known in Marconi time:
"It is now perfectly well known that a condenser, if large enough, does not
prevent the passage of high frequency oscillations, and therefore in these
cases
the earth is for all practical purposes connected to the antennae." (Marconi
1909).

In reality the real condenser conducts (electrons are flowing) the DC but do
not AC.
In the teaching program is opposite.

J. Schneider published his results in 2006 after 15 years of experiments.
The National Cancer Institute confirmed it.
Your "alternatives" were the old ones.

But J. Schneider wrote:
"I have no idea if my body was unique in its response to this agent
(saturated solution of Epsom salt + Vit C).
It is obvious that that much more laboratory and clinic testing is necessary
before anyone could recomended this agent to anyone else for their use".

Now I know that my body is also unique.

I agree with you in 100%.

But the J. Schneider cancer cure is not an alternative.
It is tested in the National Institutions.
>
> Feel free to try Mr Bialek's recommended treatments. However, have

Not my but John Schneider who discovered the cancer cure and Grab Saddle.
S*

What an utter idiot.

Who wants to try to explain to this babbling idiot that the impedance of
a capacitor is 1 / (2 X pi X f X C) which means if f is zero (DC) the
impedance is infinite and there is no conduction (in an ideal capacitor).

The NCI doesn't confirm anything or do any research or experiments.
They're a government organization that catalogs, organizes, and
reports on other peoples and organizations research. The only place
where the NCI funds reports are for maintaining the statistical
database and running regular surveys of best practices and research
trends. I believe (not sure) that they also insist on peer reviewed
research.

Searching cancer.gov and scholar.google.com for "J. Schneider epsom
salt", I find nothing. URL please? Any double blind clinical trials?

The Leyden jar is small. Holds only a few dozen coulombs. Shoebox holds hundreds and I already have plenty of shoeboxes, plus friends who have shoeboxes. The lid needs to be taped down or the mutual repulsion of the electrons will push it up and off.

> In about 2006, I discovered that I had prostate cancer.

I got the bad news in 2005, after several years of a rising and falling PSA and one negative biopsy in July of 2004. I had been watching news for prostate cancer, so I knew what the treatments were, who was using them and what the success rates were. (Now, seven years "down the pike," things may be different; my perspective reflects best practices as of my diagnosis.)

I opted for surgery. When my urologist asked what I wanted to do, I already knew. I said, "I want it out with the da Vinci robot."

He said, "We have that."

I said, "I know." I had read that my provider had gotten the first robot in San Diego earlier that year. I was referred to the surgeon who bought the robot and was accepted as a candidate. Six weeks later, done. PSA undetectable ever since; he got it all. Officially "cured" in another fifteen months, eight years post-op. I was probably lucky in many regards. The urologist was aggressive and he admitted it.

He said, "I do more biopsies than anybody I know. It means I catch more cancers." (The biopsy has some slight pain associted with it but it's only mildly uncomfortable. I'd take a dozen in preference to having a tooth capped, for example."

My provider, having just gotten the robot, didn't require me to ask them to pay for me to go off-network. My surgeon was the Chief of Surgery who had moved up through Urology, so he had done thousands of prostatectomies. I go back to see him every year. He's since been promoted to Chief of Staff but he still works Urology. Great guy.

Some things:

CHARACTERIZATION: See if the noise is truly on all the bands. Check every band for which you have a suitable antenna. Tell us what bands are bad and how bad. Is the problem the same at 2:00 AM as at 8:00 PM? Do you have access to a spectrum analyzer?

LOCALIZATION: Get yourself a lot of coaxial cable, perhaps 100 feet and relocate a portable antenna to places around outside your shack while another ham calls out the S-meter reading every time you stop someplace and ask for it. You don't have to have a particularly good match so I'd suggest you DON'T need ground radials -- just a hamstick on the end of the cable. Don't hold onto it while your buddy takes the reading; hold it upright with a plastic or wooden stick a few feet long. Consider buying or borrowing a portable radio that covers the frequencies affected.

ISOLATION: If you can localize the source, begin powering down. You may be able to switch off breakers, pending other persons in the house having their TV go off, or the kitchen go dark at dinnertime, etc. Run your rig off a battery so you can power down your entire shack. The source could be in a neighbor's house.

WILD GUESS: Does the tuner have any active circuitry in it? It would be a real b*tch if the noise were being generated inside the tuner. When you mentioned "unhooking the tuner," you didn't say which side you were unhooking.

SNEAK FACTOR (1): A battery-backed-up device, like a smoke detector, CO detector or burglar alarm could be the problem, but I doubt it.

SNEAK FACTOR (2): If you have more than one problem, you may not know about Number 2 until after you fix Number 1.

Good luck. I worked interference problems for the Navy and sometimes you need luck to back up your skill.

So far the best light (warm white), best efficiency and relatively low
noise seems to be from Philips LED bulbs. The ones that have the orange
top are the best. Nothing else comes close. In Minnesota I think there
is a deal going on with Home Depot and the power company because the 60W
Philips bulbs that are normally $40 online everywhere have been $15 at
Home Depot (here) for months.

They are much better than any other LED Edison style bulb I have
purchased, and I've bought quite a few trying to figure out what's good.

The best price/performance is at the 60W level where the $15 bulb
produces 810 lumens for 12W with color rendering at something like 80.
The better version of the bulb does 1100 lumens (or so, can't remember
the number exactly) for only 10W and has about a 99 color rendering
rating. And is $50, only available online. I'd love having that one,
but the math doesn't work out even if I have it for 30 years. I'll wait
for the price to go down.

1367. adding WARC bands to an old Wilson SY2 tribander question

Newsgroup: rec.radio.amateur.antenna
Date: 2012-06-06 06:25:59 UTC
From: VK3XL <VK3XL.a14f0b8@radiobanter.com>
Message-ID: <VK3XL.a14f0b8@radiobanter.com>
Source record: 1836

After an interesting weekend working DX on 17 meters using a homebrew 5 band vertical antenna, I had a thought..... how much better would it be to have a 2 or 3 element yagi on 17 and maybe 12 as well.

So here is the plan, either open sleeve feed the 17 and 12 meter driven elements by close coupling it to the trapped driven element of my old Wilson SY 2 tribander that is at 50 feet above the ground. Or build a open sleeve fed 17/12 meter 2 el yagi and position it on the same boom as the tribander and run a separate feeder to the 17 meter driven element thus allowing greater separation of the new elements from the original tribander elements.

I have looked around for generic trapped tribander models (MMANT-GAL) but have found nothing. I am new to antenna modeling, but have read that trapped triband yagis are difficult to model.

Is there any experience on the forum with this type of modification of an existing tribander and if so what were the results like.

I have a fair stock of aluminium to make the new elements from, so the project will cost me not much than the time I invest in it.

I am not interested in buying an all singing 5 band optibeam or StepIr antenna, I would like to increase my performance on 17 and possibly 12 meters without degrading my performance on 20, 15 and 10 too much. I also suffer from short arms and deep pocket syndrome.

Your thoughts (and sensible responses) are appreciated.

Mike VK3XL

> salt", I find nothing. URL please? Any double blind clinical trials?

I have come accros Epsom salt in 2007.
The most interesting was Schneider's "CANCER CURE PAGE".
It starts it words: "I mix my cancer cure as i explain in item #4 on this
"CANCER CURE PAGE"
I have the printout but without URL.
Two years ago I have lost the all what was on my PC.

Schneider did not write why the Epsom salt cure cancers. So it was
interesting for me the two steatments:
"ALL cancer is a funge" and "that
magnesium sulphate (Epsom Salts) saturated solution in water is deadly to
almost any fungus/yeast. Well, after 1 week of applying this it has sorted
out my basal cell and removed it completely. That stuff is dirt cheap and
works."

It is known since XVI century that Epsom salt cures all skin problems.

Todey I found:
"
Sea Salt Water Drink -
Dr. F. Batmanghelidj MD believes that salt is vital for theprevention and
treatment of the cancer. Cancer cells - he explains- cannotleave in an
oxygenated environment. When the body is well hydrated and saltexpends the
volume of blood circulation to reach all parts of the body, theoxygen and
active immune cells in the blood reach the cancerous tissue anddestroy it.

All refined salt should be discarded as its harmful to the body"

Unrefined sea salt has many Mg and S ions.

Do you use the unrafined sea salt?

S*

You and teachers live in the ideal world where are the ideal capacitors.

Leyden jar has insulator made of glass.
It is possible to make it with insulator "made" of the air.

What will be leakage in such case?

Errr ... if your computer used capacitors with air dielectric then I doubt
we'd hear from you again.

If it helps you, capacitors pass AC and block DC.

Regards, Ian.

They're about $40 at Home Despot. I was there yesterday to check. I would probably have bought them except that the cheapo 8 watt Ecosmart LED lights were on sale for $10/ea. I don't know if you caught my comment, but I have 3 of them (now 4) but only one generates RFI. I was going to exchange it for another, but forgot to bring it to the store. Maybe next time.

>The best price/performance is at the 60W level where the $15 bulb
>produces 810 lumens for 12W with color rendering at something like 80.
>The better version of the bulb does 1100 lumens (or so, can't remember

>rating. And is $50, only available online. I'd love having that one,
>but the math doesn't work out even if I have it for 30 years. I'll wait
>for the price to go down.

By comparison, the 8 watt EcoSmart 40w bulb produces and insipid 430 lumens and a 3000K color temperature. Like all the blue+yellow=white bulbs, they tend to favor the yellow. My eyes can be easily fooled, but my camera and spectroscope shows the obvious:
<http://802.11junk.com/jeffl/crud/EcoSmart%209%20Watt%20LED.jpg>
Argh... I can't find the spectra photo. These look like fun:

I live in the real world and it is trivial to verify that the impedance
of a capacitor is 1 / (2 X pi X f X C).

As usual, you are totally confused.

```
Each insulator is a weak conductor.
At DC and pulse current electrons are flowing through the insulator
(leakage).
At AC not.

At AC the charging/discharging take place. The electrons flow into plate and
come back.

Charging current and discharging current do not pass or by-pas the
capacitors.

An insulator is ... an insulator. No leakage. If an insulator is not
insulating then you'd better handle your mains leads with care.

Hello folks.
I'm not sure about "Hopefully not off topic" but I have a niggling feeling
that cancer treatments, Epsom salts (even though I used to visit Epsom) and
suchlike may not be appropriate for rec.radio.amateur.antenna
so perhaps Szczepan should find a more appropriate medicine, homeopathy or
cancer newsgroup such as :
free.uk.medicine.complementary
free.uk.homeopathy
alt.support.cancer
sci.med.diseases.cancer

Regards, Ian.

I have a special oil extracted from the fat cells of rattlesnakes that
cures all cancers. Please send check for $500 for one pint.

This oil also provides artificial earth ground for all antennas.

Michael

I would avoid a 718 if I were you. They are a terrible design and difficult to repair. I own a 730, two 740s, and a 751A. I bought them all used and none worked right or at all. They were easily repaired and have very good basic designs. One of the 740s had so many things wrong with it that it took me a week to repair. I am retired and my time is free.

The 751A is about my favourite but the 740 has a better receiver. Probably because it is limited to the ham bands.

Keep us posted about which radio you buy and how the repair worked out.

Michael

Hello Michael. A friend of mine used to breed rattlesnakes. He accidentally knocked over a box of electrons and found that the rattlesnakes loved to chase and eat the shiny ones. They didn't eat the dull ones. He wonders why this is.
He also threw some protons, neutrons, oldtrons and croutons for them to eat. They liked the croutons. Some rattlesnakes liked the protons. They'd then curl up around the mains wire and transmit to each other on 1.3GiggleHertz.

73, Ian.

... not for this group, per se, but at least
it concerns an antenna.

With apologies to Joyce Kilmer, I give you my own "Trees":

Trees -- a poem for users of roof-mount TV antennas

I think it's very sad to see,
My Channel Master in a tree.

A tree with many branches prest
Against the dipoles, all distressed;

Some stormy winds quite fierce and strong,
That seemed to whistle all night long,

Blew down my mast and all that's on it;
The tree got everything upon it.

Next week I'll have to go and pay,
And buy a shiny, new eight-bay.

But meanwhile this house needs TV;
Which means I'll need to climb that tree.

"Sal"

So after you saying he lives in a world of ideal capacitors you now proclaim that a Leyden Jar is an ideal capacitor? Pot, kettle.

Because it's not a real world "practical and useful in actual devices" capacitor, Leyden Jars inhale vacuum like almost nothing else in the capacitor universe. They are useless in virtually all practical applications.

So Leyden Jars normally occupy the absolute bottom of the capacitor list.

I have found both electron types useful in my basement. The spiders
think the dull ones are prey and are killed by them. Similarly most
crawling insects are killed by the shiny ones.

H* Tom.

Turns out that, on my keyboard, the dot on the letter between H and J *s a
loose electron and *t's dropped off. *'m us*ng the * character to represent
the letter between H and J.
Hold on a m*nute. When was the keyboard *nvented? *f *t comes after Faraday
then *t can't ex*st wh*ch makes wr*t*ng th*s ema*l very, very d*ff*cult.

73, *an.

No. Jar is heavy weight, cardboard box is light weight. Cardboard box is easier to stack than jars in order to increase capacity. Have to buy jars whereas cardboard shoe boxes are usually free from the shoe shops and are an ideal size for storing electrons.

What did Marconi say about brown shoes?

No, it was Jimp who is of the opinion you are an ignorant, babbling
idiot that doeesn't understand ANYTHING.

The epsom salts reference was just an example of how big an idiot you are.

I was thinking about using fiberglass reinforced body filler as an insulator and was hoping someone here may have some experience doing the same. It would be used to support the low impedance end of a gamma match. Power level not to excede 200 watts HF.

Your eyes are suppose to more sensitive in the yellow area than blue.
Getting the ratio between the blue LED and the yellow phosphor right
is a major headache. Among my 4ea Ecosmart bulbs, I can't really see
much variation. However, my camera certainly sees differences. One
is rather blueish, while the others are varying shades of yellowish.
I'll try to take a phone of all 4 of them at the same time. That's a
problem right now because they're installed all over the house.

Also, another advantage of LED light bulbs is that they can be dropped
without breaking.

It's made for "raves" but works equally well for a fast spectrographic
analysis. There are other diffraction grating type spectrometers
available, but it's difficult to beat the price.

Sort of. I believed as you until last evening.

I finished mounting new solar panel 1 of 2 the previous day and all adhesives and sealers were very well set. Took my Vanagon camper out for a test drive and while on a freeway entrance ramp (decreasing radius of course) I heard a loud clank. Ignored it as per "driving in traffic rules" - Drive First, Worry About Noises Later.

After I got home I noticed that one of my clamp lamps had fallen off it's preferred perch. And the Edison screw base on the Philips LED bulb wasn't quite on anymore. Looking close I noticed that the metal base was a sort of crimp onto the underlying plastic. Very tiny and sharp crimps on the upper edge of the screw base. I pushed it back on. So far so good.

There shouldn't be much voltage at the gamma match feed point.

Which fiberglass filled body putty where you considering?
<http://3mcollision.com/products/fillers-and-glaze/reinforced-fillers>

Looking at the various MSDS sheets, it looks like a reasonable
insulator that's not going to absorb moisture.
My comments and guesswork in [xxxx]:

1,3-ISOBENZOFURANDIONE, POLYMER WITH 2,5-FURANDIONE AND
2,2'-OXYBIS[ETHANOL] 30 - 60%

[The volatile solvents.]

TALC 10 - 30%

[Good insulator. Steatite insulators are baked talc.]

STYRENE MONOMER 10 - 30%

[Styrene monomer is probably propylene oxide. I couldn't find
anything in its electrial properties. My guess(tm) is that it's quite
good as styrene plastics are sometimes used as insulators.]

MAGNESIUM CARBONATE 10 - 30%

[That's chalk. It's hygroscopic and absorbs moisture. It's probably
there to remove any water from the talc, which will make talc
conductive.]

CHLORITE (MINERAL) 1 - 5%

[That's a harder form of talc. My guess(tm) is that it serves the
same purpose as the soft talc, but is there to help prevent shrinkage
during hardening. I'm not sure this is correct.]

FIBERGLASS Mixture 1 - 5%

[There's the fiberglass filler. Of course, glass is a good insulator.
However, I don't think 1-5% fiberglass by weight is going to add much

insulating ability to the mix. You might as well use Bondo, without
the filler.]

FIBER 0.5 - 1.5%

[Same as fiberglass]

OXIDE GLASS 0.1 - 1.0%

[Any of a dozen glass oxides. All are good insulators]

That's a good way to determine if it will work at 2.4GHz. However, this is for HF, which is about 1/500th of 2.4GHz. Some insulators that fail at 2.4Ghz (PVC, nylon, phenolic, wood, bakelite), work just fine at HF frequencies. In general, if it passes at 2.4GHz, it will probably work at HF. However, if it fails, it may still work at HF.

There's also the potential problem of volatiles and solvents. Some of the components in the body putty are hygroscopic (absorbs moisture). When baked in a microwave oven, the water and solvents may boil, resulting in cracking or crumbling. Residual ethanol solvent might make an interesting bang. Microwave baking is a fair test to see if the body filler will handle 1KW of RF at 2.4GHz, but might be a bit overkill for 200 watts at HF.

Loss tangent (dissipation factor) can increase or decrease with
frequency depending on material. It's measured at 1KHz, but can be
almost anything by the time it gets to microwave frequencies. For
example, glass:
<http://psec.uchicago.edu/glass/tanDelta_vs_freq_edited.bmp>

>> There's also the potential problem of volatiles and solvents. Some of
>> the components in the body putty are hygroscopic (absorbs moisture).
>
>Well if they do they will not be good even at HF.

Time to define "good". The OP proposes to use Bondo at the low
impedance end of a gamma match. That's 50 ohms. It would
considerable conductivity to put anything in parallel with 50 ohms to
have an effect.

Even placing an obvious conductor between the 50 terminals isn't going
to do much. For example, I could place a water balloon full of salt
water between the 50 ohm terminals. As long as rubber provides
sufficient insulation, there will be no dielectric loss. It might arc
over or add some capacitance depending on size, but it won't conduct
RF.

However, were he to propose using Bondo at the junction of the
matching tap section and the tuning capacitor where it hits the driven
element, there will be problems. The gamma match is a series resonant

tuned circuit at this point with high voltage across the capacitor. In effect, the Bondo would act as part of the capacitor dielectric at high voltages. Bondo is not suitable for building capacitors.

>> When baked in a microwave oven, the water and solvents may boil,
>> resulting in cracking or crumbling.
>
>Not a problem if it is just a test sample, but if they absorb water they
>will be a poor insulator.

Not exactly. A water soaked insulator is certain a potential problem. Yet, there are perfectly usable insulators that contain water. For example, concrete, bricks, and some pottery are contain considerable water, but are tolerable insulators, especially if glazed. HF has no effect on the water because there is insufficient energy at 2-30MHz to convince the water molecule to vibrate. The higher the frequency, the higher the energy:
E = Plank's-constant * speed-o-light / wavelength
While building an HF antenna structure out of bricks is feasible, I would not suggest you place a brick in a microwave oven. It will get hot and eventually crumble as the water evaporates. For a higher speed example, just hit a brick or concrete block with a oxy-acetylene torch and be prepared to duck as pieces fly out as the water explodes.

>>Residual ethanol solvent might
>> make an interesting bang.
>
>I think we must be thinking about a different type of filler, all of the
>glass fibre fillers I have come across do not contain ethanol, they are
>2 part; styrene monomer and organic peroxide hardener

Please re-read my summor of the contents from the MSDS sheets. The stuff is 30-60% ethanol solvent by weight. That's needed to keep the mix flexible and compliant. As it evaporates, the Bondo hardens. However, if some residue remains, such as the result of applying the Bondo in too thick a layer, there is a real possibility of a gas explosion.

Well, I lied. Apparently it only gets hot and does not crumble:
<http://www.youtube.com/watch?v=aCRBeo2hsmU>
(7 mins). This has to be the most boring YouTube video ever. However,
watching the author get burned by the brick when he tries to remove
the brick from the oven is priceless.

Also, not that power line insulators are quite hygroscopic (absorbs
moisture). The surface glazing is a good moisture barrier so the
insulator insides remain quite dry. However, even a small crack in
the glazing will eventually introduce enough water into the inside to
cause arcing.

>Please re-read my summor of the contents from the MSDS sheets.

Oops... that should be "summary".

Should work OK. I vaguely recall doing it myself once years ago.
I forgot what I did, but I think I had to strengthen a base
insulator on a vertical that was fixing to break or something like
that. Or maybe I had a make a base insulator from scratch..
I forgot..
I used fiberglass body filler that had strands of fiberglass
mixed with the liquid stuff. It was fairly strong once dry,
and I don't recall having any problems with the insulating
properties.

Made a trip down to the local electrical supply place and they had a deal on some odds & ends stand off insulators that I could imagine being machined into what I needed. Cleared there junk table of them for $10. Seems to be made of fiberglass reinforced plastic.

First don't get to hung up on ingredients look at what it becomes after
the reaction which is polyester.
If you need the part to have adhesion or be structural or just stronger
you could thicken epoxy resin with talc, chalk, glass micro balloons,
silica, chopped glass fiber.

The sun is not nice to unfinished-unprotected polyesters or epoxides So
you should consider the RF properties of what ever you will use to
protect the part from UV.
The parts you bought are still made of the same type material so you
still need to consider protecting them where you have machined away the
outer layer.
Regarding the ingredients:
2,2'-OXYBIS[ETHANOL] is a reactant not a solvent (and not ethanol)
1,3-ISOBENZOFURANDIONE and 2,5-FURANDIONE are organic acid
anhydrides.
Styrene monomer is styrene (AKA vinyl benzene or phenyl ethene).

The talc and chalk minerals are to thicken the mixture and make sanding
shaping the hardened piece easier.

Most paints are insulative or at least non-conductive and should be
fine.
The filler should be fine also.

1420. 20m Field Day Quad

Newsgroup: rec.radio.amateur.antenna
Date: 2012-06-13 05:18:38 UTC
From: "Sal M. O'Nella" <sobars@aol.com>
Message-ID: <jr97r7$v5u$1@dont-email.me>
Source record: 1886

I'm building a quad for Field Day. I have 30 feet of 1 1/2' PVC that I know will stand up with appropriate guys, because I used it to support the center of my dipole last year.

The driven element and reflector will be 8 1/2 feet apart, so I built a 9-foot PVC crosspiece fitted with a T-connector to go in the top of the mast. I'm going to put a wooden pole inside the crosspiece -- just in case I have a PVC failure. (t's cheap insurance.) The elements hang fro the crosspiece.

As described to me, this quad doesn't use spreaders, per se. The idea is to tie ropes to the left and right sides of the elements and draw them out to the sides, forming an approximate diamond shape. Hanging from 30 feet, this antenna's feed point is about five feet above the ground.

If I hang a (larger) reflector from the same height, it will effectively be slightly lower than the driven element. I do not know if I should hang the driven element several inches lower than the reflector so that they align center-to-center. I can model it. and see what happens. Because the respective shapes of the driven element and reflector will not match exactly, I'm guessing vertical alignment won't be the limiting factor.

More to come.

1421. loop antennas

Newsgroup: rec.radio.amateur.antenna
Date: 2012-06-13 22:11:06 UTC
From: garyr <garyr@fidalgo.net>
Message-ID: <jrb376$5kl$1@speranza.aioe.org>
Source record: 1887

This site http://www.frontiernet.net/~jadale/Loop.htm states that: "A properly designed Loop primarily responds to the magnetic component of the radio wave. Note that noise resides primarily in the electrical component..."

Whereas this site shows that that is not the case:
http://vk1od.net/antenna/shieldedloop.

So what is the advantage, if any, of a shielded loop antanna?

Consider three receivers:

1) Shielded loop antenna, receiver with differential input (center-tapped transformer or instrumentation amp). The two ends of the inner conductor of the antenna connected to the differential inputs and the shield connected to ground.

2) Same as above but without the shield.

3) Unshielded loop antenna, receiver with single-ended input.
One end of the loop connected to the receiver input and the other to ground.

Assuming equal gains and bandwidths, would there be any difference in the sensitivity or noise level at the output of the three receivers?

>
> So what is the advantage, if any, of a shielded loop antanna?

None. The only purpose is to ensure balance, which helps give
deeper nulls.

But that is not the only way to ensure balance. A shield is
not required for that function.
None of my AM-BC loops are shielded. I have tried shielded
loops though, just to see for myself if any difference.
There no difference, assuming all of the loops were balanced
and fed properly.
The mythology of loops is a lot like the various myths you
see pertaining to grounds, and grounding. :|
Some claim a shielded loop is "quieter" than an unshielded loop.
I know from testing, that is pure hogwash.
Both are quite capable of picking up noise. After all, noise is
RF just like any other signal, and follows all the same rules.
The true test of a small loop is how deep the nulls are.
If you can make daytime AM ground wave signals disappear by
turning the loop, you are in pretty good shape.
And *any* small loop is capable of that if all is well in the
world.

> I'm building a quad for Field Day.

< snip >

> More to come.

Today, I modeled the 20m quad antenna with EZNEC. It looks good at 75 ohms feedpoint impedance, with the entire phone portion coming in under 1.5:1, post-tweaking. It was promoted to me as a nominal 52-ohm antenna but the SWR was a half-point higher when I swept it at 50 ohms. I have no problem feeding it at 75 ohms; that's exactly what I did with last year's dipole. The model had just over 9 dBi gain at a 40 degree takeoff angle. At a 25 degree takeoff angle, the gain is still a respectable 8.0 dBi

At first look, I'm surprised to see how sensitive the tuning of the driven element was to the height of the feed point above the ground. That seems to have a more profound effect than the length of the driven element. I'd have to play with it some more to know for sure.

I wondered about the effects of the vertical position of the reflector. I moved it around in the model and it seemed to have only minor effect on the parameters. Reducing the size of the reflector sharpened the SWR dip without doing much of anything good. I'm staying at 5% when I build.

The reflector is called out to be 5% larger than the driven element. This is at odds with other quad designs I found on the Internet. The want about 3%. The difference may be that a 3% larger reflector may be better for a tower-mounted quad, while this design is quite close to the ground.

Only 1.4:1 where resonant.. Shouldn't be a problem unless maybe
you stray down the band a good ways.. May not be much of a problem
on 20m.

Probably not hugely critical in the overall scheme of things.
And with the variances of the location and setup, completely matching
the model will probably not happen.

I haven't done field day in a few years.. Getting lazier and lazier
I think..
I have a pretty good setup for field day, but I have to feel pretty
motivated to drag it all out. :/
I've got a short tilt/crank tower, and a A4S. I can haul it all
on a motorcycle trailer. Actually, the tower will fit in the back
of my truck, but I later started using a trailer, as it seemed easier.
Here is a view from above one year..

http://home.comcast.net/~nm5k/fd01-1.jpg

This is from a later year when we were setting it up.
That is my old truck and trailer.. "It's a 68 F-250, which I still
have". You can see the motorcycle trailer on the back.. It's made
from a VW axle and tires... Has shocks and rides smooth.
You can also see my plastic bugcatcher on the truck bed. That's
the 11 ft center loaded version. Works 80-10.. It's 14 feet if
I add the three foot solid Hustler mast to the base. Which puts
the coil up at eight feet.

You can't tell it from the pictures, but that tower is *very* stout.
It's using a heavy base a friend of mine cut at a shipyard, using a
plasma cutting table. You can stick the antenna on the tower, and
crank it up, and it will stand up by itself, even with no guy wires,
or anchoring the base down.
Of course, I do guy it just to be on the safe side.
They supposedly won 10m phone with that A4S one of the years I
brought it.
Myself, I hardly ever used the thing out there.. Others do..
I always stick to the low bands on CW at night. 160,80,40..
And I prefer just coax fed dipoles for those bands.
That antenna has always worked well so far.. It's basically
full size, even on 20m. "32 ft elements" And it uses a separate
reflector for 10m, which gives a more optimum spacing for that band.
It's three elements on each band. If I remember right, the antenna
is about 31 ft up when fully cranked up. Not real tall, but good
enough considering it's 20-10m.

Do you use them to the "direction finding"?

"The advantage of this feed arrangement is that the coaxial feed typically
enters the loop opposite to the gap, and if attention is paid to symmetry of
the loop and feed, the balance that is achieved. Best balance yields the
deepest null which is important in direction finding applications for
instance."

Hello, and a loop (dipole) antenna doesn't "respond" to just the magnetic (electric) component of a propagating electromagnetic wave. A (receiving) loop or dipole antenna intercepts the incoming electromagnetic (EM) wave. Last time I checked an EM wave had both electric and magnetic components. Just because an orientation of an axis of the antenna resulting in maximum signal strength is parallel to the electric or magnetic component of an EM wave doesn't mean that it's responding to just that component.

I wish hams and others would quit trying to redefine electromagnetic theory. Hams have designed and constructed novel and practical antennas over the years but their explanations about how they work are often just plain wrong. Sincerely, and 73s from N4GGO,

I agree with your second link (by VK1OD).

The time varying magnetic field generates an electric field and that
is received by the loop. When you screen it completely, it doesn't
work, you need the gap.

By placing the gap opposite to the feed point, you get a balanced loop
without the need of ferrite or other constructions. If you can get
balance via other means, you don't need the screen. Balancing the
loop reduces noise due to common mode issues. This isn't different
from using a balun between a coaxial cable and a symmetrical dipole.

Your option three may behave competently different, as the coaxial
cable, power supply cable, switch mode power supply, etc may
contribute to reception of signal and noise due to common mode to
differential mode conversion.

From my experience (reception) with electrically small well-balanced indoor loops and indoor dipoles, I found some advantage of the loop over the electric dipole at low frequencies (say below 3 MHz). I contribute this mainly because of the nulling capability. Whether is applies to your location depends on the field distribution of the noise at your location.

At higher frequencies there is difference in S/N ratio, but not in favor of one antenna. Sharp nulling wasn't possible. So to know what option is best for you, you need to try it. Maybe install both options and select the antenna that gives best results as this will depend on frequency and the angle of arrival of the radiation you want to receive.

Other thing that may really help is to find your local source(s) of noise, use lots of ferrites and try to find a sweet spot for best S/N ratio.

Amateur radio DF on VHF (very popular) tends to use yagis.
Loops seem to be used more for MW and HF DF.

The explanations are wrong because the radio waves are simply the electric
waves or the electron waves.
From this point of view the next is obvious;
"Since the directional response of small loop antennas includes a sharp null
in the direction normal to the plane of the loop, they are used in radio
direction finding at longer wavelengths. The loop is thus rotated to find
the direction of the null."

" Although a similar argument may seem to apply to signals received in that
plane, that voltages generated by an impinging radio wave would cancel along
the loop, this is not quite true due to the phase difference between the
arrival of the wave at the near side and far side of the loop."

No. I use them for MW broadcast reception.
I generally don't use them much above the 160m band.
My largest loop covering from longwave to about 2 MHZ,
using switchable caps.

Yes. I expect most of the work to be between 14.220 and 14.340, where the SWR is acceptable. I have no problem using the tuner in my RS-870 to show the radio perzackly what it wants to see.

> And with the variances of the location and setup, completely matching
> the model will probably not happen.

Yeah, I get that. The reasons I modeled it at all were (1) to verify that I didn't have any gross errors and (2) to play with the parameters so I could see what effects resulted from certain changes. I'm thinking of putting the analyzer on it (or transmitting tune power into it and tugging or slacking the guy ropes on the left and right corners of the driven element for a good match. After I get it up, I'm limited as to what I can do with the driven element length. I did consider putting a telescoping section into the driven element, tuning and then then soldering in a replacement of equal length. I don't think I'll go that far.

Some quad designs that I saw online depict an adjustable length section in the reflector. It's shown as the reflector conductors coming down to their low point where they are several inches apart and then being bent to go parallel, with a shorting bar placed (selectively) across the parallel-running conductors. This effectively provides a length adjustment for the reflector. Since this is my first quad, he learning curve is still fairly steep.

I'm getting there, myself. Age = 69. Club President, FD Chairman, VE, Multi-elmer. I have a hard time saying "no."

This year we're using N3FJP's Field Day Logging software for the first time. While it will make for instant dupe-checking and a very fast dupe sheet generation for the report to ARRL, getting it set up has consumed many hours.

Thanks for the pictures. Maybe I'll do a yagi beam next year. I've had
them for many years on 2m & 440 but never a one for HF.

Yep.. Sounds like you are fairly locked in.. :|
These days, if I really wanted to do field day, I generally
prefer to go up to my own land, if I'm going to go to all
that trouble. That way I can do other things I need to do,
when taking a break from the radio.
Exciting stuff like mowing grass, clearing brush, etc.. :+

But I really don't care for contest/field day type of
operating all that much. About the only reason I did it,
was to help pad the club's scores a bit.
Being I work only CW, I can rack up some decent points if
I feel motivated. And on the bands I work, they are swarming
like flies..
One handy thing about the puter logging is being able to see
if what you are hearing is a dupe or not, without having to
scan sheets of paper.

But generally, my idea of "field day" is kicking back in
one of my lawn chairs, sipping on a cold adult beverage,
and talking to all those good ole buoys on 75 or 40... :/
I already have dipoles strung up there, so all I have to do
is unroll the coax, connect to the radio, and I'm off to the
races.

That sounds nice and I've considered it, too. In the early days, I didn't know nuthin' about nuthin', so going with the club was absolutely the best thing for me. Now, twenty years on, I can do whatever I want (within budget) and it'll probably work out.

I will say, however, that the field day experience does provide an opportunity to try new things that I might otherwise not attempt. Putting up a 20m quad is best done by a crew.

Father's of the radio also.
Maxwell's model was discarded by Royal Society and the Heaviside's was done after the fundamental experimments.
Radio waves and light are the oscillatory flow of electrons (L. Lorenz 1869).

Hello Szczepan.

We've tried to assist you but you seem to prefer to stay with 19th century knowledge rather than learn modern knowledge. If you ask for help and don't accept the answers you get then there's not a lot we can do ... other than disregard your postings and go and operate our radio stations.

You need to get a modern textbook on radio theory. One suitable for amateur radio should be okay. Have a look at www.rsgb.org.and www.arrl.org

Kindest regards, Ian.

So you are saying that cases 1 & 2 above are essentially equvalent if the
loops are balanced. In terms of noise rejection, there is no analogy to be
drawn between a shielded loop and a shielded cable.

It depends on the individual amateur, doesn't it. That's why we experiment,
write articles, read textbooks and discuss and debate theory and practise.

Lorenz (and all other physicists and mathematicians) were obviously ignorant of photons in those days. Here is what a more knowledgeable physicist has said more than a century later:

Quoted from: "The Strange Theory of Light and Matter", (c)1985, by Richard P. Feynman

"So now, I present to you the three basic actions, from which all the phenomena of light and electrons arise:

-Action #1: A photon goes from place to place.
-Action #2: An electron goes from place to place.
-Action #3: An electron emits or absorbs a photon."

When Feynman says "light", he is including RF. Photons travel at the speed of light in the medium which is impossible for electrons which possess rest mass. There are no electrons in a pure vacuum, yet light and radio waves pass through it at the speed of light with no problem.

Following your "logic", why go back to 1869? Why not question the periodic table of elements because a few millennia ago, men of science asserted that there are four elements: earth, air, fire, and water. So why not adopt the four element argument as well?

Cecil,

I think our Polish friend here is just a troll trying to get attention.

It is a complete waste of time reading his posts, just put him on your kill list.

In the end for almost all amateur radio operators it does not matter one wit how an antenna works. It most certainly matters if it works and how well.

I have used a 75 meter loop antenna here where I live for the past 5 years. It works very well. I live right in town on a lot surrounded by other homes. I started with a dipole but was advised that a loop would hear less noise. It turned out to be quite true. I am now a convert to the loop antenna. Have no idea of the physics of how it works, but it sure does work well on bands between 75 and 20 meters. It actually seems

to work best on 40 meters.

I don't care about electrons or the names of past pioneers in radio. I mean no offence to them, I just have moved on since being a child studying radio.

Michael

Hello Gary,

You are right, it is what I am saying.

There is no analogy between the shielding function of the braid in a coaxial transmission line and the shield in your loop.

For the "shielded" loop, the received voltage is across the gap in the shield. The shield is the actual single turn loop. The inner conductor is just there to transport the received signal to the opposite side of the gap where you can go down (with coaxial cable) to your receiver, maintaining balance.

Theoretically a coaxial transmission line system is completely closed. Water from the outside can't reach the inner conductor, source or load. When cutting a gap in the screen, the coaxial transmission line system will leak.

Shielded loop with more turns
If you run more turns within the shield of the loop, you pass the gap many times. When you pass it 3 times, you will get three times the voltage, hence the impedance and loop inductance increase.

It is not true. Only in the cases of corona buildup, etc, on the
elements would that be the case.
If you hear less noise with the loop, vs the dipole, it's due to
the change in pattern. Not due to any qualities of the loop itself.
Noise is RF the same as any other signal, and follows all the same
rules. It's no different than an actual signal.
If what you/they say is true, and the loop received less noise, it would
also receive less "desired" signals. Or in other words, everything
would be down vs the dipole.
The most likely explanation is the change in pattern less favored
the direction the noise is coming from. Either that, or the noise is
local to your shack, and for some reason the loop's feed line is better
decoupled than the one feeding the dipole.
If I had to bet, I'd say it's the change in pattern.
There are no magical anti noise properties with loops.

He may be talking about precipitation static which was considerably reduced for me in the AZ desert when I converted my dipole to a folded dipole. My problem was dust storms even on a sunny day.

http://www.its.bldrdoc.gov/fs-1037/dir-028/_4096.htm

P-static is unrelated to the reception of EM RF far-field signals. It is a static charge transferred from charged particles in the air directly to an antenna. It was so bad in AZ that arcing occurred at my coax connector. I have actually seen the p-static envelope on my IC-756PRO's display.

The problem with a dipole is that one element of the dipole normally does not have a DC path to ground. When the p-static discharge takes place, it may be through the series capacitor in the receiver. With a loop antenna, including a folded dipole, the p-static usually has a path directly to ground from any point in the antenna system. It's not the only path but it certainly reduces the p-static noise although not completely eliminating it.

Of course, it is possible to reduce the p-static problems on a dipole with a parallel resistor/choke, a 4:1 voltage balun, or heavily insulated wires. Hams who live in low p-static areas of the country will invariably say that there is no such thing because they have never seen it. But hams who have lived in the AZ desert know better.

>
> http://www.its.bldrdoc.gov/fs-1037/dir-028/_4096.htm
>
> P-static is unrelated to the reception of EM RF far-field signals. It is a static charge transferred from charged particles in the air directly to an antenna. It was so bad in AZ that arcing occurred at my coax connector. I have actually seen the p-static envelope on my IC-756PRO's display.
>
> The problem with a dipole is that one element of the dipole normally does not have a DC path to ground. When the p-static discharge takes place, it may be through the series capacitor in the receiver. With a loop antenna, including a folded dipole, the p-static usually has a path directly to ground from any point in the antenna system. It's not the only path but it certainly reduces the p-static noise although not completely eliminating it.
>
> Of course, it is possible to reduce the p-static problems on a dipole with a parallel resistor/choke, a 4:1 voltage balun, or heavily insulated wires. Hams who live in low p-static areas of the country will invariably say that there is no such thing because they have never seen it. But hams who have lived in the AZ desert know better.
> --
> 73, Cecil, w5dxp.com

True, but I mentioned that first thing..
"
Only in the cases of corona buildup, etc, on the
elements would that be the case. "

The "etc" including what you are referring to.. I was
just too lazy to include that in the list. :/

But say here in Houston, with the high humidity, we rarely
ever see the type static you had in AZ.
You can also see that in some snow storms from what I hear.

But I mainly want to vote against the idea that a loop, with
no static problems, has the ability to receive less noise as
far as radiated RF from other sources.

It's one of those myths "as far as I'm concerned" that needs to be put out of it's misery.
For instance, some will claim a small shielded loop that is indoors, will receive less noise than an equal size unshielded loop in the same location. Have never seen that to be the case here, when comparing them. In fact, both the loops I kept for permanent use were regular old unshielded diamond loops. The biggest being the PVC frame loop that is 44 inches per side as I recall.. I have another one that is a circular loop about 16 inches dia. The large one is 7 turns. The small one I think 12 or so.
I tried using shielded loops, but the performance was the same. I also tried using shielded loops as the coupling loop inside the larger unshielded loop. Worked fine, but no better than an unshielded coupling loop with no balance problems.
I kept the shielded coupling loop for the small loop, but used plain wire on the large one. It was easier to thread through the spreaders, and also lighter.

I understand that my experience contravenes your theories about how
antennas should work.

I had several local hams suggest that I use a loop after I kept
complaining about noise. I finally put it up. It is more difficult to
erect than a simple dipole. It is at the same height as was my dipole 35
feet.

The receiver noise level dropped dramatically. I was so glad I went to
the trouble to do it. I finally took down my dipole after switching back
and forth for a year just to be sure the dipole was not better in some
circumstance.

The other effect was an immediate increase in the signal received by my
friends who live within about 200 miles. We operate at 3913. I could not

figure this out until I consulted a pdf file about antennas. The 75 meter loop has a 9 dbi gain at the optimum height of 25 feet. Mine is a bit high but still gets some gain. All my friends reported on this increase in my output signal. This information can be found at http://www.hamuniverse.com/n4jaantennabook.html

This configuration is basically a NVIS antenna. It works so much better than did my dipole. It gets pretty good dx on 40 and 20. I use an Imax 2000 for 15 and 10.

So, I and my friends know that this antenna works better than a dipole by actually using it for several years. One of the hams in our group has been using a loop hung from 2 200 foot towers in a vertical position. He has done extensive experimentation over the last 45 years.

And yes, a 75 meter loop at 35 feet above ground has a different pattern than a dipole. I don't care why it works better at all. I and others just know that it works better and with less noise than a dipole.

And no, a loop antenna is not magic. It is different than a dipole. Different types of antennas behave differently. The worst antenna I hear on the air comes from people using G5RVs. Their signal is just totally lame when they use the recommended 80 foot dipole on 75 meters. If they would just extend that same antenna to 120 feet they would do so much better.

Sorry my loop works so well.

Michael

Here is quote from N4JA's informative antenna book.

.....XIV. ONE-WAVELENGTH SINGLE LOOP ANTENNAS

1. The Horizontally Oriented Loop

To calculate the length in feet of any one-wavelength loop, divide 1005
by the frequency in MHz. Horizontally oriented one-wavelength loop
antennas have become very popular on 160, 80, and 40 meters and it is
one type of NVIS antenna. (NVIS stands for "near vertical incidence
skywave" because of its high angle radiation pattern.) It is claimed by
its users that the loop antenna is quieter than other antennas. This is
because it doesnt pick up the noise from power lines, thunderstorms,
etc., coming in at low angles. These antennas radiate on their

fundamental frequencies with a broad pattern straight up to put a strong signal for nearby contacts. Recently published articles on this type of antenna have called them "cloud warmers." There are other types of antennas called NVIS antennas other than loops. They are dipoles at low heights or dipoles with parasitic reflectors placed under them to cause the signal to radiate mostly straight up. The NVIS antennas have an advantage in working nearby stations because you dont get the static noise and interference from far distances. They are definitely not DX antennas. An article on NVIS antennas appears in the December 2005 QST......

I guess my hunch on the difference being pattern related
panned out.. :)
I've used horizontal loops on the low bands. But I came to the
conclusion they were generally not worth the extra trouble, vs
a dipole. I could barely see any difference here from the usual
dipoles I ran. And if the signal is stronger at one angle or direction,
vs another antenna, it's weaker in another. So it's all a compromise.

On the low bands, I came to the conclusion my favorite antenna for
mostly NVIS and medium path work was the turnstile.
Which are crossed dipoles. You can feed them in or out of phase
for either dipole patterns, or with them 90 degrees out of phase,
for a fairly round omnidirectional pattern.
I like to do well to the close in stations, but also the ones
farther off too.. So even if I used a loop, I would generally
try to get it as high as possible.
Which I also do using dipoles, or turnstiles.

Wim,

Thanks very much for your lucid explanation of how shielded loops function. I've been using one with a receiver I made to monitor VLF signals. It works quite well and I had thought it was because of all the local noise I was avoiding. But then I stumbled across VK1OD's article...

Best regards,
Gary Richardson, AA7VM

PS
Thanks also to all the other respondents. This has been a very interesting thread.

A loop is a loop is a loop, meaning that one side conductor goes
upwards while the other side goes downwards in contrast to a
linear wire antenna or a dipole which is extending in one direction
only. The up-and down (left and right) parts of the wire cancel out
each other at least partially when collecting energy from an electric
field, while the energy uptake from a magnetic field is proportional
to the loop area.
This electric noise cancellation is not perfect, due to unsymmetries
in the field, therefore it pays to shield the loop wires and decrease
the electric influences further.

I hope my explanation is simple enough.

Feynman has been called the "Great Explainer".[22] He gained a reputation
for taking great care when giving explanations to his students and for
making it a moral duty to make the topic accessible. His guiding principle
was that if a topic could not be explained in a freshman lecture, it was not
yet fully understood. Feynman gained great pleasure[23] from coming up with
such a "freshman-level" explanation". The below is the example:

>"So now, I present to you the three basic actions, from which all the
>phenomena of light and electrons arise:

>-Action #1: A photon goes from place to place.
>-Action #2: An electron goes from place to place.
>-Action #3: An electron emits or absorbs a photon."

>of light in the medium which is impossible for electrons which possess rest
>mass. There are no electrons in a pure vacuum, yet light and radio waves
>pass through it at the speed of light with no problem.

Feynman was a teacher. The scientists were the opposite opinion:

"
In 1900, Max Planck was working on black-body radiation and suggested that the energy in electromagnetic waves could only be released in "packets" of energy. In his 1901 article [4] in Annalen der Physik he called these packets "energy elements". The word quanta (singular quantum) was used even before 1900 to mean particles or amounts of different quantities, including electricity. Later, in 1905 Albert Einstein went further by suggesting that electromagnetic waves could only exist in these discrete wave-packets.[5] He called such a wave-packet the light quantum (German: das Lichtquant). The name photon derives from the Greek word for light, ??? (transliterated ph&#65533;s), and was coined[Note 1] in 1926 by the physical chemist Gilbert Lewis, who published a speculative theory in which photons were "uncreatable and

indestructible".[6] Although Lewis' theory was never accepted as it was contradicted by many experiments, his new name, photon, was adopted immediately by most physicists. Isaac Asimov credits Arthur Compton with defining quanta of energy as photons in 1923."[7][8]

For scientists the photon is like the tone in sound.

In the pure vacuum are electrons. Do not you know about the Dirac electron sea?

S*

Following your "logic", why go back to 1869? Why not question the periodic table of elements because a few millennia ago, men of science asserted that there are four elements: earth, air, fire, and water. So why not adopt the four element argument as well?

Yes, I know about it but Dirac nor anyone else who matters has claimed that electrons can travel at the speed of light. The thing that travels at the speed of light has been proven to be quantized, i.e. to consist of discrete packets or particles. It has been 84 years since Dirac came up with his theory. It is now generally accepted that Dirac's "sea of electrons" is made up of something other than electrons, i.e. dark matter/energy, in a quantum structure which results in the Casimir effect.

Here's the problem with a "sea of electrons" or virtual particles to explain the quantum structure:

http://science.nasa.gov/astrophysics/focus-areas/what-is-dark-energy/

"But when physicists tried to calculate how much energy this would give empty space, the answer came out wrong - wrong by a lot. The number came out 10120 times too big. That's a 1 with 120 zeros after it. It's hard to get an answer that bad. So the mystery continues."

For Faraday, Lorenz and Tesla the light and radio waves are exactly like the
sound.
So we must distinguish the speed of the light and the speed of the particles
of the medium.
For Faraday, Lorenz and Tesla the medium is the plasma (ions + electrons).

So the key issue is if "In the pure vacuum are electrons". Are they?

?The thing that travels at the speed of light has been proven to be

The "electron waves" or oscillatory flow of electrons is simply seen in the
crystal radio and rectennas.
But everybody prefer "So the mystery continues."

Everyone's attempts to reason with Snicklefritz Dingle (sz.bialek@wp.pl)
will come to naught. It reminds me of a joke:

A farmer was having a hard time with his new mule. The stubborn mule
wouldn't take the harness. Reluctantly, he hired a mule-trainer, who
arrived promptly the next morning.

The mule-trainer picked up a sledgehammer and slammed the mule between the
eyes. The mule staggered backwards from the blow.

"Hey," screamed the farmer, "I don't want you to kill my mule!"

"Relax, pal." replied the mule-trainer. "Before you can train 'em, you have
to get their attention."

In my considered opinion, nobody really has Snicklefritz's attention.

The full-size G5RV is 102' (not 80'), and works pretty well as a
shortish halfwave on 80m. The half-size is 51', and is intended for 40m
and above. However, although maybe not the antenna of choice, with a
tuner and 450 or 600 ohm twin feeder it should be possible to make even
an 80' dipole work fairly effectively on 80m.

One amateur (local to me), who I believe has limited space, reckons that
a straight, short dipole works better than a squeezed-in, dog-legged
full-size dipole. I think his is 85', and it certainly works well on
80m.

If empty space were filled with a "sea of electrons", their combined massive gravity would have an observable effect but actual gravity calculations prove that the "sea of electrons" cannot exist. You are correct about there being a medium through which EM waves flow, but it is impossible for it to consist of any form of known visible matter. Exactly what it consists of is still a mystery.

If empty space were filled with electrons, we would be able to measure the drag caused by the electrons. Any known particle of matter with a rest mass would cause a drag on movement of matter through it.

You remind me of the story of the man who is looking under the street light for his lost keys even though he lost them a block away. His explanation was, "I'm looking for my keys here because the light is better."

On 160m, I had better luck using a full size "Z" dipole than
I did shorter dipoles that were loaded with high Q coils.

I sort of agree with him about the G5RV, but it's the feed that
is the problem, not the length of the radiator. Generally too much
feedline loss with the way most people run them. Same problem with
many of the various commercial Windoms that they sell.

I prefer the full length dipoles because it's easy to feed them in
a low loss manner. On the low bands, it's very hard to beat a dipole
fed with coax for overall system efficiency. Maybe nearly impossible,
being as I've never found anything more efficient so far.
I suppose a tuned feeder of ladder line would be as good, "IE: the Cecil
method" but not nearly as convenient.
I never could match coax performance using ladder line and a tuner.
Close, but not quite.. No matter how careful setting the tuner using
the very minimum of inductance.

I guess that's why I'm such a coax fan... May not be good for multi-
band use with a single dipole, but for single or limited band use, very

hard to beat.

I remember one year I got stuck using some kind of Windom for 80 and 40
at field day.
It was terrible... I swore never, ever again..
But sure nuff.. The next year they tried to stick me on a windom again.
But I was ready.. :) I brought everything I needed to make a dipole
on site. Which I did. I then whipped out a coax switch so I could
A/B the two antennas, just to prove I wasn't barking at the moon.
When you switched to the coax fed dipole, *everything* jumped up
at least full 2 S units on his rig. His eyes got big as saucers.
He never really suspected he was losing that much.
Needless to say, I stayed on the coax fed dipole.
The RF mayhem of field day is no time to be using lossy compromise
antennas.. I never could see that, when you have enough room to
use just about anything.

Here's one that will beat most RG-8x fed dipoles.

I use 213 though... :) Your method is about the only other one
I can think of that should be as good. On paper, slightly less
loss than the coax, but being I've never compared them side by
side, I couldn't say if your method is actually superior enough
to see a difference on a meter.. I've never tried your method of
feeding. The physical aspects are not too convenient for me most
of the time.
In the case of the ladder line/tuner vs coax, the difference was
small, but enough to notice a bit of difference on an S meter.
Of course, I'm using received signals to judge. Things should be
reciprocal, so I usually don't bother trying to do transmit tests
as I consider it less reliable than quick A/B comparisons and my
eyes on a meter.
Good ladder line is generally less loss than good coax, but on the
low bands, the loss per foot of good coax is pretty low.
I would think the advantage to your system would increase as you
rise in frequency. IE: at 50 Mhz, might be quite worthwhile.. Or if
long runs are involved. When I ran ATV on 70 cm, I preferred TV twin
lead over coax for the UHF TV antenna I used for receive.
It had less loss than coax to a 4:1 TV balun. As long as it was dry..
Wet? Nearly useless... :(

All physisists (not teachers) are opinion that in space is enough matter to
propagate the electric waves.

In "empty space" is ISM (interstellar medium = ions, electrons and dust)

>we would be able to measure the drag caused by the electrons. Any known

Michelson discovered in 1887 and 1925 that ISM rotate with the Sun and do
not rotate with the Earth.
Meteorologists know that above the equator is steady wind caused by ISM.
In the rest of the globe the winds are caused by many factors.

Utter nonsense.

You are a babbling idiot.

> Faraday and Marconi did not go to schools.

Faraday attended lectures given by the Royal Institution and Royal Society.

Marconi was educated privately in the lab of Augusto Righi, in Florence
at the Istituto Cavallero and, later, in Livorno. He also studied under
Augusto Righi, a University of Bologna physicist.

You are a babbling idiot.

I'm not sure about the "all" but indeed in space is enough matter to propagate the EM waves. But it is DARK MATTER, consisting of a different kind of matter with which none of us are presently familiar. Dark matter particles possess a certain observable mass but are clearly not electrons. The density of electrons in free space has been sampled by space probes and there's simply not enough electrons to support EM wave propagation in free space.

Do yourself a favor and concentrate on discovering what the "sea of dark matter" is all about. Dark matter is estimated to occupy 84% of all the matter in the universe and one thing is certain - it is not leptons of which electrons are a group member.

I haven't read the rest of this thread, but you may find a clue to
your question here: http://youtu.be/aAcDM2ypBfE

Uploaded by atommodel on Aug 11, 2010

UNLOCKING THE MYSTERIES BEHIND RADIO WAVES.
Electric current creates magnetic field, oscillating electric
current creates oscillating magnetic field and not
"electromagnetic wave" as current belief. Electron has a standing-
electric field and magnetic field at right angle (watch video
structure of electron). The flow of electrons in a conductor is
essentially caused by the attraction between the electric fields
of mobile electrons and "fixed" positive charges in the conductor.
Oscillation of electrons in a conductor is caused by the
alternation of electric polarity in the conductor. Because of
electric field and magnetic field of an electron is at right
angle, when oscillates the electric field of the electron will be
parallel to the oscillation and magnetic field will be
perpendicular to the oscillation.This oscillation of the electron
creates transverse wave on its magnetic line and the oscillating
magnetic line is radiated to space.

What's the diference betwee an photon and an electron?
http://www.quora.com/What-is-the-difference-between-a-photon-and-an-electron
... an electron is a tiny particle that has an electric charge, and
a photon is a tiny, massless particle that we can perceive as
light.

http://van.physics.illinois.edu/qa/listing.php?id=2348

Q: Why are photons (all wavelengths) considered to be
instruments of the so-called "electromagnetic force"? So far as I
know, please correct me, photons have no electrical charge nor are
they influenced by magnetic fields. The term "electromagnetic
spectrum" seems to me to be very inappropriate and highly
misleading.

A: Grahame- You're right that electromagnetic waves, whether
viewed classically or in terms of quantized photons, are not
affected by static electrical or magnetic fields. They have no
charge. Nevertheless, they do exert electrical and magnetic forces
on charged particles and magnetic particles. Viewed classically,
they consist of nothing but electrical and magnetic fields
propagating through space, so it's entirely appropriate to call
them electromagnetic waves. ...

Photons are little units of light -- they are the original "quanta" of
quantum mechanics. Their existence was hypothesized to explain the
details of the photoelectric effect -- photons with enough energy can
knock electrons out of materials. Since then, photons have been found
to play a central role in the explanations of many physical phenomena,
from explaining how much heat is radiated by hot objects to modern
quantum cryptography.

But on to your question! The classical model of electricity and
magnetism makes use of the ideas of electric and magnetic fields.
Maxwell's equations describe how these fields behave, and the Lorentz
force equation, which describes how the fields push and pull charged
particles and magnets. A prediction of Maxwell's equations is that
there are waves in the electromagnetic field which travel at the speed
of light. These waves were identified with light by the experiments of
Hertz and others. We therefore have two very different ideas for how
light works -- as waves in the electric and magnetic fields, and as
motion of particles -- photons. This pair of explanations is called
"wave-particle duality" and is a recurring theme of quantum mechanics.
Depending on the experimental situation, light acts as a wave or as a
particle (but never both simultaneously).

Weirder still -- static electric and magnetic fields also exhibit wave-particle duality. The collision of a charged particle with another (repulsive or attractive) can be modeled as the exchange of photons and you get the same answer as if you had calculated everything with just the classical fields (in the limit that the classical calculation applies -- slow incoming particles). The quantum calculation involving the exchange of photons is more accurate in describing actual collisions at higher energies.

And now the really weird part. You might ask -- "Photons travel in straight lines at the speed of light. Why doesn't the electric field of a charged object just zoom away at the speed of light?" It turns out that the photons which make up a static electric or magnetic field are "virtual" -- their energy and momentum doesn't satisfy the relationship for "real" photons -- E=p*c (E is energy, p=momentum, and c is the speed of light). The virtual photons are constantly emitted and reabsorbed. A charged object with an electric (and possibly also a magnetic) field is surrounded by an entourage of photons, constantly being emitted and reabsorbed.

Photons, real and virtual, are emitted and absorbed by charged particles, even though they are not charged themselves. They only interact with charged particles, and not with each other. That's why photons don't interact with magnetic fields -- the photons which make up the magnetic field are not charged so other photons cannot interact with them.

Technical p.s.: photons have entourages of electrons (and other stuff) around them, and so photons can interact with other photons by interacting with this cloud of charged stuff. The effect is so small it hasn't been observed yet for low-energy photons. Very high-energy photons produced in particle accelerators may collide with themselves readily.

Tom

Follow-Up #1: photon sources

Q:

...and how does a photon (real or virtual) carry or represent the information about the charge (eg +/-) that it's interacting with?
- Paul (age 57)
UK

A:

It may be easiest to describe this in terms of classical electromagnetic fields, which already contain the essential ingredients. Charged particles are sources of these fields. The way in which charged particles give rise to fields is captured in the Maxwell equations. Charge itself gives rise to a 'divergence' in the electric field. Current gives rise to a 'curl' in the magnetic field. However, looking at the fields in some region does not give all the possible

information about the sources. For example, a static field might come
from a little nearby charge or a lot of far-away charge.
Mike W.

I conferred with our local guru on this matter, professor Michael
Stone. He thought about it for some while and then said 'It's
tricky'. His explanation is that an ordinary, free, photon has two
different transverse polarization states as can be easily demonstrated
by the usual crossed polarizers experiment. An electron that
interacts with this kind of photon couldn't care less where it came
from. It just scatters ala Compton. Now in the case of when the
photons are virtual, such as when two electrons are close to each
other and are experiencing
Coulomb-like forces, the photon has an extra, longitudinal,
polarization state. This extra state carries information as to the
charge sign of its source. Hence the electron receiving the photon can
decide whether to be attracted or repelled.

rec.radio.amateur.antenna
metal dector for barbed wire fences

Anybody here have any suggestions for possible ways to detect fence wire,
mostly 1, 2 or 3 levels of barbed wire but also some 8 inch square matrix?
Typical mounting would be on a tractor or trailer, so the detector would need
a sense of direction, ie looking outward not inward. Minimum range would be
around one foot with 4 feet probably optimum.
Typical retail metal detectors have a short range and need a metal free
environment, leaving the methods they use somewhat doubtful. Evidently, there
are detectors with seperate heads/coils and 1-5 foot ranges but, once again,
require a metal free environment.
One possible area would utilize rf antenna's, one transmiting and the other
recieving a reflection from the wire(s). A parabolic or corner reflector type
antenna maybe if not for the high frequency - two 12 inch antenna's would be
about max size and that's in the gigaherts range, which might be a problem.
Any suggestions along this line will be appreciated.

If there is a free end accessible you might try feeding some rf into it
and then following along with a receiver to detect the underground
portions. This may or may not require strong attentuation at the
receiver antenna -- using a short loop or something across the input.

If there is one level. chances are you may find others underneath with
a little digging unless there are accessible ends to them whereas tracking
the RF would work just as well.

Just a wild and maybe not so crazy idea of how I'd try for a quick cheap
fix.

Good idea. RF tracking works very well for buried cables and should work for fence wire. I used it some years ago when we were adding antennas to an existing field and needed to know exactly where to dig only by hand. The device is in two pieces, one of which couples RF onto a cable by induction (from up to several feet away); the other piece is a receiver which detects the re-radiation from the cable up to several feet away. The transmit unit and the receive unit need to be separated about fifty feet apart or more for this to work. Otherwise, you will get direct coupling through the air and not via the conductor you're tracking. The receiver sensitivity was adjustable on the one I used.

I rented our unit from a surveyors' supply house. Rent, try, buy. good luck.

Hello, and one more (and final) time: Electric and magnetic fields by themselves don't propagate, only electromagnetic fields (EM) can transport energy over vast distances. A transmitting antenna has LOCAL (near) electric and magnetic fields but what propagates (i.e. what a receiving antenna sees as the far-field) is an EM field. A receiving antenna has an "effective area" that captures energy in the incident EM wave; what isn't dissipated in the load at the receiving antenna terminals is reflected (scattered) by the antenna (after allowing for any dissipative/ohmic losses in the antenna structure).

As economics professor Peter Morici would say "It isn't all that complicated." (But the devil's in the details). Sincerely and 73s from N4GGO,

What a small shielded loop responds to should be easy to demonstrate. We know that a florescent light bulb responds mainly to the electric field because it gets brighter as one moves it from the feedpoint to the top of a mobile antenna. The standing wave voltage loop is at the top of a resonant mobile antenna. The standing wave current loop is at the feedpoint of a resonant mobile antenna.

So simply take the small shielded loop and see where it responds the best up and down a mobile antenna. If some people are correct about it responding mainly to the magnetic field, the measured field strength will be highest at the base of the mobile antenna where the standing wave current is the highest.

Hello, and one has to make the distinction of whether the receiving loop is in the near or far field with respect to the source of the incident energy. A quick test is to note whether shorting or open-circuiting the terminals of the loop (or any receiving antenna for that matter) has any effect on the current flowing into the terminals of the source (transmitting) antenna. If there's no effect then the receiving antenna is most likely decoupled inductively (magnetically) and capacitively (electrically) from the transmitting antenna. What is seen as available power at the receiving antenna in that case is due to its interception of a propagating EM field. The fact that the orientation of an axis of the antenna aligns with the E or H component of an incident EM field is just a result of the applicable electrophysics. Sincerely,

There is the knowledge amongst most hams who work low bands that a loop antenna has much less noise than a dipole at the same height. This is especially true in a suburban area. The ability to hear the other station in a qso is profoundly effected by the noise level heard in your receiver.

I just had a very long conversation with a fellow ham who has been experimenting with antennas for over 50 years. He has lived in the same rural place all that time. He has no homes anywhere near his own. His noise level in his receiver is not much reduced by using a horizontal loop. He does like loops and his most used antenna is a 160 meter quad loop vertically mounted with its top at 200 feet.

Anyway I was trying to understand why my loop antenna reduced my noise level in my receiver by so many S units. After at least an hour of conversation we got to the fact that I had built a portable loop antenna for 2 meters as a direction finder. He pointed out how sharp the null was when this antenna was pointed (edge on) toward the source station. He then said to take this antenna and then turn it horizontal and see if I could hear anything. Voila. Nothing at all was heard. I finally understood the reason for the remarkable noise immunity of the loop antenna. The loop simply nulls all noise and signals from its edge on plane. So, any signals from nearby homes, power lines, and industry are received by me at this very low angle of radiation. They are nulled out. I receive only high angle radiation. This is also true of transmitted signal and thus the large amount of gain it has as an NVIS antenna. This is not magic, just physics.

My 75 meter transmitted signal in the day stops at about a 300 mile radius. This is fine for me. It may not be fine for others. I regularly talk to California from Michigan during the night on 75. This same antenna works DX on 40. I do not understand why at this point. I have received an S9 signal report from Barcelona Spain on 40. It also works other bands, but its performance on 40 meters is better than any other band. In any case my interest in this subject was piqued when someone here said that it was just mythology that loop antennas had any more noise immunity than a dipole. I knew this was not true from my own experience but wanted to understand why. '

So in finishing up, a horizontal loop probably offers little noise immunity when operated in the countryside where you have no nearby sources of interference. It offers a lot of noise suppression when operated in the city or suburban areas.

Michael

One thing must be mentioned:
The noise cancelling effect of loops is best when the loop is small
compared to the wavelength.
As the loop gets greater, the effect reduces to nil.

Imagine an electric field
------------------------------------>
------------------------------------>
------------------------------------>
------------------------------------>
------------------------------------>

now imagine the loop, I can only draw a square
in fixed pitch font:

>>>>>>>>>>>>>>>> upper conductor
| |
| |
| |
| |
| |
<<<<<<<<<<<<<<<< lower conductor

It is immediately clear that the upper part
signal will be cancelled by the lower part signal
and the same applies to the left and right parts
of the loop and of course this applies also to
a circular loop in the electric field, while the signal
from a magnetic field perpendicular to the computer screen
where you are watching this, ahemm..., the magnetically
induced signal adds up around the whole circumference
of the loop.

I hope the SECRET of the loop is finally lifted
and everybody says: yeah, I knew it anyway,
you don't have to tell me, it is so simple.

Large loops do not cancel out the electric signal completely
as the el. field is not in phase on all sides of the loop
and therefore such a loop should be shielded.
When acting at 20 meters, a meter diameter loop is small
compared to the wavelength, at 150 MHz a 40cm diam. loop
is no longer small compared to the wavelength.
This is where shielding helps to minimize electrical
field pickup.

A loop antenna reduces one type of noise considerably compared to a dipole, i.e. precipitation static which is unrelated to EM far-field signals.

If you ground your dipole properly, you have no static.

If you ground your dipole properly, you have less static.
Commercial dipole antennas also are shielded for that reason.
Ever seen one?

I was referring more to small loops used for receiving. Not large
loops.. It's mostly in the case of small loops that many claim a
shielded loop is "quieter" than an unshielded loop. I still consider
that claim as pure hogwash...

This is not the same as the full size horizontal loops you are using
on 75m. But.. Even in this case, the loop is not any "quieter" than
the dipole. Like I said before, and you've had verified by the other
guy, it's the pattern that changes, and may receive less signal at
certain heights or angles. There is no "immunity" to noise. It's just
that the change in pattern has less gain at the lower angles than the
usual dipole at the same height.
As you have noted with your conversions with the other guy...
If the noise were from overhead, as in lightning 200 miles away, the
noise of which goes up, and reflected right back down like any other
signal, the loop would be the noisiest, by about a 1/2 db.

If you model a 80m dipole at 30 feet, the gain at 5 degrees is -10.49
dbi according to the plot I'm looking at in eznec.
If you model an 80m full size horizontal loop at 30 feet, the gain at
the same 5 degrees is -12.72 dbi. So.. about 2 db or so, which happens
to be the appx gain the loop has over a dipole in free space.

So, if you have a noise source on the horizon at 5 degrees, you can
expect it to be a good 2 db down on the loop. But even 2 db is not
all that much. Usually less than an S meter on most receivers, but
could vary. So on paper, the signals at low elevations should be down
on the loop, but not hugely so.
The only difference in the pattern between the two antennas is the
dipoles pattern is a little more squat than the one from the loop.
The loop has a tighter beamwidth than the dipole.

At 90 degrees, "straight up" there is only about .4 db difference
between the two antennas. "8.82 dbi vs 8.41 dbi" That's hardly
enough difference to see on a meter. And one reason why I came to
the conclusion the loops were not worth the extra work and wire..
But I'm not trying to reduce signals from low elevations..

If you raised both antennas to 50 feet, the gain at 5 degrees
with the dipole would slightly increase.
With the horizontal loop at 50 ft, the gain at 5 degrees will be
even less than at 30 ft. I wasn't really expecting that, but
that's what the plots are showing.

Both are very good at NVIS paths. BTW, both are using the same
"medium ground" qualities in eznec.
The best way to see the difference in pattern is modeling them.
This is the elevation plot of the 80m dipole at 30 ft.
http://home.comcast.net/~nm5k/80dipole.jpg

This is the 80m horizontal loop at 30 ft.
http://home.comcast.net/~nm5k/80horloop.jpg

Both were made using the eznec demo.
http://www.eznec.com/demoinfo.htm

One problem is calling it noise immunity. When one says a
loop is immune to noise, it *is* a myth.
If an antenna were immune to noise, it would be immune to all
signals. Would be a fairly useless piece of hardware.
If you point a loop towards noise, it will pick it up just as well as
any other antenna, if the gain at a certain angle were equal or greater
than another antenna.
Saying it has less gain at a certain lower angle is more accurate in
your case. And that gain at low angles will increase as you raise the
antenna off the ground.

BTW, 300 miles is about average for 80 in the day, dipole or
loop.. And your loop couldn't be too awful bad at the somewhat
lower angles, or your contacts to CA wouldn't pan out too well.
That is one handy thing about the eznec program. You can use the
mouse and place the green angle indicator at any angle, and see
what the gain will be. You can see on both of those plots I
set it for 5 degrees. The "DBmax" is the level compared to the
gain at it's maximum angle, which in both of these cases, is straight
up.

I'm in the city of Houston, not out in the country. And I never
noticed the horizontal loop to receive much less local noise
than the dipoles or turnstiles I have used.
But generally, I don't have bad noise that would overpower
the usual atmospheric noise on 80m at night.

Ooops.. That is generally the case, but as earlier mentioned, I
actually saw less gain at 5 degrees with the hor loop at 50 ft,
than I did with it at 30 ft.. Which would likely help with
reducing your local noise. I don't know how high yours is..
But the dipole gain at low angles did increase with height
above ground.

Don't forget the effects of polarization. At my previous QTH, my horizontal dipole was about 2 S-units less noisy than my vertical even when communicating with remote vertical antennas.

ISTR with my portable shielded loop, when its horizontal, its omni;
when its vertical, max received signal is when the edge is pointing to
the tx. The null happens when the plane of the loop is at right angles to
a line to the tx.

I'm not. I'm just trying to show that an antenna can't tell what
is noise, and what is an actual desired signal. To the antenna,
they are both the same. RF.. One can not magically filter noise,
without filtering the actual signals along with it.
This applies more to the small receiving loop, comparing shielded
to non shielded, but also would apply in most any other case.
I'm fairly comfortable saying the claims of reduced noise pickup
with shielded loops is a myth. I've compared them, and I saw no
difference here. And that includes the usual far field signals,
but also closer local noise, such as monitor noise from the shack,
etc..
I never saw any difference with that type of local noise either.
Both types picked it up equally well if it was there.
And both types could null it out equally well, if from a single
source.

Say, you have interference with a local origin and a signal with
a remote origin, wouldn't it be possible to tell the two apart?

E.g. by using two antennas. The received signal is the same on
both antennas but the noise is different. This can be used to
cancel out the local noise but keep the remote signal. Phasing boxes
that operate on this principle are commercially available, so maybe
it is possible.

Sure, but that's a whole different thing entirely.
That's nothing to do with the antennas themselves.

But once you move a bit further away and consider the two antennas
and phasingbox together as a single antenna, it suddenly is capable
of telling apart local noise and distant signal. That is promising.

As I said above, I am not talking about atmospheric noise. I am suppressing the local noise generated in my community by various electrical and electronic devices. These are close enough to arrive where I live from an extremely low angle. This low angle is exactly what my loop "magically" nulls out.

I understand now that when I use it at multiple wavelengths that it no longer behaves as it does where it is a single wavelength on 75 meters.

All the contrarians keep citing atmospheric noise cannot be suppressed with a loop. Please read my post above more carefully. I do not make that claim. If you read carefully you will see that I am trying to suppress ".... So, any signals from nearby homes, power lines, and industry are received by me at this very low angle of radiation....."

Now if you are claiming this does not work, then say so rather than talking about atmospheric noise.

Those of us who live in a suburban area bombarded with local noise know very well which antenna will be more quiet. At least those who have tried a loop. I suppose there are some suburban areas without noise. I have not lived in one.

I always prefer empirical evidence over theoretical postulates. Those who prefer to defer to a theory over evidence are welcome to do so. I like to use what actually works.

There appears to be an anti-loop antenna feeling among some people. I have no such innate prejudice against most antennas. I have tried various types of antennas and use what works best where I live. I found the random wire antenna and the G5RV to be the worst performing of all antennas I have tried. If I had no room for a loop, I would use a folded dipole. After that, I would use a simple 1/2 wave dipole. I have tried the double bazooka but found it only marginally wider in bandwidth than a dipole and heavier and more difficult to support.

I do admit that I find the wide spread acceptance of the G5RV by new hams to be a mistake. I certainly understand why they might originally chose this antenna. It claims operation from 75 meters to 10 with just a 102 foot length. This is an attractive specification, but comes with a serious performance cost.

Michael

I see little if any chatter about atmospheric noise.
The only mention I've made of it was to say if the noise is
from overhead, the horizontal loop will receive it very well.
As will a dipole, turnstile, and many other antennas.

>
> I understand now that when I use it at multiple wavelengths that it no

Also the height above ground in wavelength should be considered.

I've already stated two or three times that it's the pattern
that causes what you see. I never said it didn't work.
In fact, I showed in the model that 2 db would be fairly easy to
come by. Maybe more, if you raised the loop to 50 ft.
All you are doing is continuing to show I was correct as far as my
initial guess for the reason. I said it was almost surely the pattern
from the first post. You seem to be intent on proving me right.. :/
OK, I give up. You win. I concede I was right from the first guess.. :|

I know what you are doing works for the noise you are trying to reduce.
But it's working for a different reason that some *others* propose,
usually when discussing small loops.
Like I say, the noise issue I harp on is more often discussed when
talking about small receiving loops, not full size loops.
It's a bit different issue than what you see with a full size
horizontal loop on 75m.

>
> Those of us who live in a suburban area bombarded with local noise know

There are no absolutes.. It depends on the noise source, polarity,
direction, etc.
If I have noise, it's usually line noise from the power lines.
There could be cases where the dipole received less of that noise
if the orientation was just right.

>
> I always prefer empirical evidence over theoretical postulates. Those
> who prefer to defer to a theory over evidence are welcome to do so. I
> like to use what actually works.

As do I. And I've tried the loops, believe me.. When it comes to 75m,
I've pretty much tried everything trying to get the very last drop of
performance to NVIS paths. 160, 80 and 40 is where I've always spent
most of my time.

I have no problems with a loop. I just have a problem with saying they
receive less noise for the wrong reasons.
Note the title of this thread. It's mainly about small receiving loops,
and the title infers that they may offer noise suppression if you use a
shielded loop vs an unshielded loop.
I consider that hogwash. All the shielded version offers is a better
chance of it being balanced. But it's quite easy to build an unshielded
loop that is balanced. If both are balanced, both will perform the same
assuming the same size loop.

The double bazooka actually has more loss than a plain wire dipole.
It's the loss that increases the bandwidth.

The G5RV can be OK if fed properly. Straight ladder line would
work much better than the usual coax/choke/ladder line that many

use. It's the silly feed systems they use that kill the performance.
It's that coax/choke/ladder line feed config that kills the performance
of most of the commercial windoms also.
If I ran a G5RV, or any other single dipole for multi band use,
I'd feed with ladder line the whole way from the rig to the antenna.

I have no idea how to ground a dipole and I don't think I've ever done it
except by accident.

I welcome any direction. (Having just read the foregoing, I have not
searched the Internet, yet.)

The G5RV is not a miracle antenna. However, those who find that it does
not perform fairly well probably have not bothered to find out why it is
like it is, and where the radiation goes on the various amateur bands.
If they don't want an antenna with a radiation pattern like the G5RV,
then they should choose a different type of antenna.

Apparently, you have never had P-static problems with your dipoles. I, however, had a coax connector start arcing in the middle of the night and it sounded like a machine gun.

A G5RV is a good performer on 75m, 40m, 20m, and 12m. Here's why on 75m and 40m.

Hi Cecil,

I've moved off the loop and noise suppression thread and over here because
I'd like to consider an idea, and get yours and other opinions on the matter
of adjusting the 300 ohm feeder length on the G5RV.

On your G5RV page http://www.w5dxp.com/G5RV.HTM
you state that if some method is devised to vary the length of the
300 ohm series matching section it could be made to work well
on all bands.

I was wondering about using a Lecher Wire Feeder in the
shack. It would be fed from the rig by some 50 ohm
coax, and then used as the beginning of the300 line feeder, the
remainder would run out the window and up to the antenna.
.
This would allow quick and easy of adjustment of optimum
length for each band. For me, using 34 feet on 40M, and
23 feet on 10M, an 11 or 12 foot lecher setup would do
the trick.

I have seen your switched twin-lead arrangement and it
is still under consideration.

A couple of questions (which may give rise to more....)

1. How much radiation would I find in proximity to the
lecher feeder and 300 ohm twin lead. Purely a health
consideration It will not affect me as

(1) I have worked
around a lot of RF in my times -- as a tech at navy
broadcast trasmitting sites, on Heavy Radars (Pinetree
Line stuff), on shipboard trasmitting equipment, and
50 plus years of ham radio: and
(2) I only run 5W maximum
(if I'm lucky -- FT-817ND), and
(3) I've already lost most of my hair, and
(4) According to family opinion I lost it all (and I'm
not talking hair) manyyears ago and am easily
certifiable now!

Is there a cure for Ham Radio RF overexposure?

2. How much variation in length could I get away
with if I wanted to use a shorter lecher system, or would
I get significant i.e. noticeable benefit by going to the optimum length

for each band? I only operate non-WARC. I would happy
restrict myself to the 80, 40 and 20M bands, and could
drop 40 if the economics and physical reality make it
worthwhile in terms of complexity and cost vs output.

3. How far from your operating position is your
feedline/switching arrangement? Have you noticed
any hair loss since implimenting the system?

I am currently in a situation where an all-band dipole
is out of the question physically, and I think that if it turns
out worthwhile, I could set up a G5RV if I fudge a bit
by bending the legs a bit here and there, I don't
care about pattern, I just want to get a signal out
where someone will hear it (hopefully).

I would have looked up Smith Chart except that
I didn't even know how to spell Smith!

Thank you Cecil and any others who care to contribute
toward this thread

Please explain further. Lecher wires usually require a short between the two wires and we don't want that. What we need is a way to stretch or shrink the length of the wires, a pair of conductive bungee cords perhaps?

> I have seen your switched twin-lead arrangement and it

I've tried other configurations like parallel mobile telescoping antennas and copper rods that slip in and out of copper tubing. The switches take no more time than adjusting a tuner and could be automated with a microcomputer and relays.

Unless the power levels are very high, IMO, a tempest in a teapot. I remember when 11m diathermy machines were all the rage. Balanced transmission line fields tend to cancel a few inches from the wires. I wouldn't grab them - just keep your body organs a foot or so away. I doubt that the RF fields can hurt your hands but that's just my opinion. I've been around RF for 60 years with no ill effects that I am aware of. Of course, RF exposure could be the cause of me being unaware.:)

> Is there a cure for Ham Radio RF overexposure?

It is non-ionizing radiation so most of what to worry about is burning. I'm sure you have burned RF holes in your fingers before. I once burned a hole in my lip from a "hot" metal microphone - still have the scar. I wasn't using a balun on a coax-fed dipole.:)

> 2. How much variation in length could I get away

I still don't understand exactly what you have in mind. If you move taps up and down a Lecher line, you will be leaving an *open circuit stub* attached which will introduce capacitance into the configuration. That capacitance will change the impedance to other than the expected value making it hard to locate a purely resistive current maximum point.

> 3. How far from your operating position is your
> feedline/switching arrangement? Have you noticed
> any hair loss since implimenting the system?

:) I've lost some hair but I am not nearly as bald as my father who was not a ham. My switches were mounted on a piece of plexiglass in a window within reach of my operating position. The switches were on the inside and the loops of ladder-line were on the outside. There's a picture of the plexiglass panel on my web page.

> I could set up a G5RV if I fudge a bit

I was once working on a magazine article describing a relay switched all-HF-band G5RV. Someone else said he had submitted such an article for publication so I stopped working on it. I don't remember who it was and have never seen such an article. If one forgoes 30m, the parallel section only needs to be switched between 28' and 38'. I guess I should go back and complete that magazine article. I could envision 10' of copper rod slipping in and out of 10' of copper tubing and controlled from the operating position, something like a screwdriver mobile antenna.

Please explain further. Lecher wires usually require a short between the two
wires and we don't want that. What we need is a way to stretch or shrink the
length of the wires, a pair of conductive bungee cords perhaps?

I envisioned a pair of reasonably close spaced conductors (like open wire
line) and no short -- in other words it would
be used with a sliding tap on each side to control the length -- thus
simulating a variable length for the 300 ohm feeder.

> 1. How much radiation would I find in proximity to the

> I get significant i.e. noticeable benefit by going to the optimum length
> for each band?

I still don't understand exactly what you have in mind. If you move taps up
and down a Lecher line, you will be leaving an *open circuit stub* attached
which will introduce capacitance into the configuration. That capacitance
will change the impedance to other than the expected value making it hard to
locate a purely resistive current maximum point.

What I mean is, for example, say the optimum length for the feedline on 80M
is 32 ft, on 40M 34 ft. and on 20M 33 ft. If I were to
use the average 33 ft. and operate only on those three bands would I notice

any significant difference -- would it make much difference
in my signal at the receiving operators shack? 99.9% of my operations over
the years have been on those three bands, and if
I didn't have to adjust the feedline length I could save a lot of time and
trouble. When I had my house, and was in fitter condition,
I could afford the effort to experiment, but now I am somewhat disabled and
what was once fun (the experimenting) is now pretty
much out of the question.

> 3. How far from your operating position is your
> feedline/switching arrangement? Have you noticed
> any hair loss since implimenting the system?

:) I've lost some hair but I am not nearly as bald as my father who was not
a ham. My switches were mounted on a piece of plexiglass in a window within
reach of my operating position. The switches were on the inside and the
loops of ladder-line were on the outside. There's a picture of the
plexiglass panel on my web page.

Within reach of the operating position makes the switching arrangement quite
viable, especially running QRP. Maybe I'll go that
way -- even a 10 ft or 11 ft lecher wire (unshorted, of course) would be far
more awkward.

> I could set up a G5RV if I fudge a bit

I was once working on a magazine article describing a relay switched
all-HF-band G5RV. Someone else said he had submitted such an article for
publication so I stopped working on it. I don't remember who it was and have
never seen such an article. If one forgoes 30m, the parallel section only
needs to be switched between 28' and 38'. I guess I should go back and
complete that magazine article. I could envision 10' of copper rod slipping
in and out of 10' of copper tubing and controlled from the operating
position, something like a screwdriver mobile antenna.

I've never seen an article of the sort myself, and I spent a lot of time
perusing antenna articles in the various
ham radio magazines. If I had, I'm pretty sure I'd remember it, even with
my increasing 'senior memory moments'!

Thanks for your reply Cecil -- as soon as I press the 'SEND' button I'll be
off to your site where I've been many times.

Nonsuch, Cecil, unless it's been an off-again-on-again
problem that I simply never appreciated for its affect on
my QSOs.

With Field Day coming and my being the Field Day Chairman
for the local club (www.sobars.org), as well as our President,
any diddling with my home QTH dipoles must wait.

I am taking an unproven design for a 20m Cubical quad to FD.
By EZNEC, it looks good but it wants a 75-ohm feed, which I am
prepared to provide. I have a choked cable ready to go.

In your opinion, is there a ground required? At the antenna or at
my van? Both? I own some ground rods and a sledgehammer.

(Last year, I used a 20m dipole at 30 feet, operating out of my van.
Everything floated above ground without incident and many QSOs.)

I value your opiniion.

In Marconi opinion:
http://www.nobelprize.org/nobel_prizes/physics/laureates/1909/marconi-lecture.pdf

"By "connected to earth" I do not necessarily mean an ordinary metallic
connection as used for ordinary wire telegraphs.
The earth wire may have a condenser in series with it, or it may be
connected to what is really equivalent, a capacity area placed close to the
surface
of the ground (Fig. 4).
It is now perfectly well known that a condenser, if large enough, does not
prevent the passage of high frequency oscillations, and therefore in these
cases
the earth is for all practical purposes connected to the antennae."

And Wiki:
"The use of the term ground (or earth) is so common in electrical and
electronics applications that circuits in portable electronic devices such
as cell phones and media players as well as circuits in vehicles such as
ships, aircraft, and spacecraft may be spoken of as having a "ground"
connection without any actual connection to the Earth. This is usually a
large conductor attached to one side of the power supply (such as the
"ground plane" on a printed circuit board) which serves as the common return
path for current from many different components in the circuit." From:

As I explained in my last posting, that won't work as expected because it leaves an open-circuit stub in the circuit. I previously tried just shorting out a loop to decrease the length. It didn't work because it created a reactive stub.

> What I mean is, for example, say the optimum length for the feedline on 80M

My 20m rotatable dipole works that way with the internal autotuner on my IC-756PRO. With ~70' of 300 ohm ladder-line, the tuner will find a match on 20m, 17m, 12m, and 10m. I was never lucky enough to achieve a satisfactory SWR on more than two bands without a tuner. However, there are certain combinations of dipole length and feedline that work on multiple bands. The ZS6BKW antenna with a dipole length of 90' and a ladder-line length of 40' is said to work without a tuner on 5 HF bands if one is lucky.

Here's a DOS-based program that I wrote that locates the current maximum points on a transmission line. It runs under XP but DOSBox is needed for later versions of Windows.

http://www.w5dxp.com/IMAXGRAF.EXE

The accompanying article is:

http://www.w5dxp.com/goodbad.htm

P.S. Two weeks ago at a neighbor boy's birthday party, I spent about three hours in the hot Texas sun playing on a large water slide and I am still paying for it.:(But if I die, I'll die happy.

What is your point is (other than demonstrating copy-and-paste)? If it is
that "all aerials require an earth" then you're clearly ignoring previous

postings which have said that this is not the case.
The Wiki item doesn't seem to appreciate the difference between a return path on a circuit board and a connection to earth.

Regards, Ian.

All time the electrons flow to or from the ground.
"Let me answer some of your questions. Capacitors loose their charge both through the insulation between the plates and through the air surrounding the capacitor. The charge is a surplus of electrons on one plate and a rarefaction of electrons on the other. Where the electrons are compacted (the negative plate) the electrons tend to push each other off. Where there is a deficit of electrons (the positive plate) electrons are attracted from other sources - air, the positive plate. Both of these actions tend to decrease the potential difference between the plates... to discharge the capacitor. From: http://www.newton.dep.anl.gov/askasci/phy00/phy00900.htm

> Troll or moron? You decide.

" Variable capacitors with their plates open to the atmosphere were commonly used in radio tuning circuits."
If you have such try to measure "the Capacitor charge holding" and decide.

Let's disregard the spelling error ("loose" and "lose").
The article continues thus:

"How can this be discouraged? There are a number of possibilities, but they
are selectively employed due to practical and economic reasons. Two possible
methods - Increase the distance between the plates or change the material
separating the plates. For instance glass insulators are sometimes used on
very large (tall as a house) capacitors or the capacitor may be packed in
oil. "

Anyone seen a capacitor that is as big as a house?

< snip >

"Often one wants a capacitor to have the largest possible capacitance. This
is accomplished by making the plates large in area and close together and
filling the space between the plates with an insulator which has a large
dielectric constant. A parallel plate capacitor has a capacitance given by C
= eA/d, where e is the dielectric constant, A is the area of the plates and
d is the separation between the plates. Notice that making the area large
and the separation small makes it easier for a current to flow between the
plates, thereby discharging them. For many purposes the small leakage
current is not a serious problem. Often a large value of capacitance is much
more important than a slow discharge. Notice that even with air between the
plates, cosmic rays will occasionally pass through the capacitor, ionizing
the air and thereby discharging the capacitor slightly."

Note the statement "makes it easier for a current to flow between the
plates". That's "between the plates" and not "flow to earth".

< snip >

"It is true, most capacitors tend to self-discharge about 50% in something like 15 minutes."
That's "self-discharge" and not "discharge to earth".

For a detailed discussion of electrons, why not try posting on one of the Physics or Science newsgroups?

Regards, Ian.

Hi folks.

Apologies for my long posting a few minutes ago. I do not like selective
quotes but I forgot that Szczepan only understands copy-and-paste.
Of course, we all kn ow that copy-and-paste is merely the movement of
electrons flying in tight formation.

Please excuse my tryping terrors - they are merely the random movement of
heavy electrons hitting the keys on my keyboard. It's worst for me when one
falls off the keyboard and lands on my foot.

73, Ian.

A valid statement but you have no clue what it is talking about or what
any of it means in the real world.

It has nothing to do with what is being discussed.

> " Variable capacitors with their plates open to the atmosphere were commonly
> used in radio tuning circuits."

Again, a valid statement but you have no clue what it is talking about or what
any of it means in the real world.

It has nothing to do with what is being discussed.

> If you have such try to measure "the Capacitor charge holding" and decide.

This is just babble.

You are an idiot.

Hello Szczepan.

No, the earth doesn't act as a surface of a capacitor. Capacitors will
self-discharge even when they aren't connected to any circuit.

Might be worth trying a standard electric fence generator. These put in a
pulse of a few 10,s of kv(as far as I know)
Probably pick it up as a 'click" on a standard AM/FM reciever. These blokes
could maybe suggest a better antenna. Just make sure you if you need a leak
you dont use the fence post!!!!!.

Just as a mental exercise, assume that the entire setup...van and antenna,
is transported to a place in space where there is negligible capacitance to
the earth.

Is it your contention that the setup would operate any differently?

Hello Szczepan.
Please try to take note of earlier postings. A dipole is a balanced aerial
and works without reference to earth.
Regards, Ian.

The Earth is in the space and the entire setup also.
The both need "neutralization" like the space-vehicle:
"Other proposed applications of large-area field emission sources[39]
include microwave generation, space-vehicle neutralization"
From: http://en.wikipedia.org/wiki/Field_electron_emission

" Where the electrons are compacted the electrons tend to push each other
off. Where there
is a deficit of electrons, electrons are attracted from other sources".

In space is the Solar wind (ions and electrons).

To continue quoting from the Wiki article: ' In these devices, a high
density of individual field emission sites is created on a substrate
(originally silicon). This research area became known, first as "vacuum
microelectronics", now as "vacuum nanoelectronics" '.
Micro/nanoelectronics? I think we've discussed ths before on this newsgroup.
Is Szczepan saying that we need to earth the Earth? Doesn't that short out
everything?
I'd rate this thread "Four stars out of five. Highly entertaining and
amusing. I await the sequel".
Perhaps we've already had the sequel - was it Archimedes who said "Give me a
place to stand and with a lever I will move the whole world". I guess that
Szczepan would agree with that one.

Regards to all, Ian.

No, Marconi was NOT correct in general and Marconi was talking about
single-ended antennas, not static build up or dipoles or loop antennas
or anything else invented the the 75 years since he died.

Marconi's remarks about antenna ground apply only to antennas working
against the Earth, e.g. a vertical antenna with no ground plane.

You see the Voyager I and II use their metal structure as one plate of a capacitor connecting to earth. The space between is the dielectric, just like the floor of the van. Some day when Voyager I passes another solar system, The space between earth and Voyager making up the dielectric will be light years wide. Without earth there could be no radio communications anywhere else in the universe.

Plato, the Greek scientist stated very clearly that the earth was the centre of the universe. Cecil, surely you would not presume to question the works of a great scientist like Plato.

The Earth is in the space and the entire setup also.
The both need "neutralization" like the space-vehicle:
"Other proposed applications of large-area field emission sources[39]
include microwave generation, space-vehicle neutralization"
From: http://en.wikipedia.org/wiki/Field_electron_emission
#
" Where the electrons are compacted the electrons tend to push each other
off. Where there
is a deficit of electrons, electrons are attracted from other sources".
#
In space is the Solar wind (ions and electrons).
S*

And if the van/antenna had been constructed on another planet before being
sent into space, is the earth still required or just the other planet?

The dielectric is in the textbooks. In real space is the rare plazma
(conductor).
" Since plasmas contain equal numbers of electrons and ions, they are
electrically neutral overall and thus electric fields play a lesser
dynamical role. Because plasmas are highly conductive, any charge imbalances
are readily neutralised."

"Norwegian explorer and physicist Kristian Birkeland may have been the first
to predict that space is filled with plasma. He wrote in 1913: "It seems to
be a natural consequence of our points of view to assume that the whole of
space is filled with electrons and flying electric ions of all kinds. We
have assumed that each stellar system in evolutions throws off electric
corpuscles into space. It does not seem unreasonable therefore to think that
the greater part of the material masses in the universe is found, not in the
solar systems or nebulae, but in "empty" space."[1]["

Hi
Do you have any links about the relative potential of planets ?
I have always been wondering what would my meter indicate if
connected between an earth and a moon terminals.
On the other hand electrons move quite easily in vacum this was used
in radio not so long ago.
But of course much slowly than electromagnetic waves.

Light (and radio waves) are the oscillatory flow of electrons (L. Lorenz
1869).

Glass, ice and water are insulators.
As you probably know the wires insulated with the water do not work.
It is the wave lenght dependent.

In telegraph wire the electrons travel (as the disturbance) with the speed
of light.
The same is in the space. The disturbance always travel with the speed of
light.

And all waves transport the mass (medium). In the our case the electrons.

But in medium are aso the winds. The speeds of them is "of course much
slowly than electromagnetic waves."

So in the space are the oscillatory flow of electrons and the electron wind.

Yes, but that is because it does not work the way you think it does.

When it was just a matter of flow of electrons, any insulator would
block the waves. The fact that some waves can pass through an insulator
clearly shows that those waves are not an oscillatory flow of electrons.

Sadly, Szczepan is around 25 years too late to be a script writer for a "Carry On" film. We've also lost Stanley Unwin who would doubtless have enjoyed Szczepan's Gobbledygook, not only because Unwin was a comedian but also because he knew a bit about transmitters.

ttfn, Ian.

Szczepan, this news that "Infrared and UV light do not pass through glass"
should be passed to Canon and Nikon and other manufacturers of digital
cameras who fit infrared filters onto their sensors. They do not know that
infrared will not reach the sensor, having been stopped by all the glass in
the lens.
According to Wikipedia, glass is approximately 75% SiO2. Quartz is SiO2.

Regards, Ian.

The use of fused quartz for UV and salt for IR is actually
something he is right about.

Ordinary glass only passes a small amount of UV close to the
visual spectrum. Lenses that go far into the ultraviolet
are made using fused quartz and fluorite elements. (This combination
gives excellent broadband colour correction so such lenses are
also used for near-infrared.)

Ordinary glass passes a fair bit of the IR spectrum but salt passes
much longer wave IR than glass does.

Peter.

Electrons and what you call "the disturbance' are completely different
things.
Nothing with a mass can travel at the speed of light.
Even in high vacuum tubes electrons travel much slower than the speed of
light
And this creates lots of problems.
Around an atom of hydrogen the electron travels at less than 1% of the
speed of light.

> Do you have any links about the relative potential of planets ?

I have a book that is still packed from my latest move. The theory is that since charged particles from the sun result in an electric current and since planets with varying characteristics (distance, size, magnetic field, etc, deflect charged particles differently, the charge on varying planets must necessarily be different. Space probes have measured the electric potential near planets and moons and one has been damaged by the intense electric fields near a moon but not in space. But think about it. Since the electric potential is not the same at different points on earth, it is likely impossible to be a fixed value anywhere else. (There are lightning discharges on the surface of Jupiter.)

> On the other hand electrons move quite easily in vacuum this was used
> in radio not so long ago.

Space probes have measured the density of free electrons in space. There are simply not enough electrons there to call space a conductor. There is something there, for sure, but it is not conventional matter. Apparently, the "aether" consists of dark matter.

The "disturbance", which is a DC transient condition, has been proven by measuring instruments to consist of photons. All AC, RF, and transient (disturbance) DC phenomena (within a telegraph wire) involve photons that are emitted and absorbed by electrons, which act as a sort of bucket brigade for the photons. If something travels at the speed of light in the medium, it cannot be an electron. A single electron, traveling at the speed of light, would collapse the universe.

In a 1 mm telegraph wire carrying 3 amps of DC, an electron travels at a velocity of about one meter per hour. I can walk 3000 times faster than that. It's time to come to grips with electron particles containing mass vs speed of light functions.

I earlier said an electron traveling at the speed of light would collapse "the" universe. I should have said: collapse "its" universe.

Almost all energy is in visible light.
In greenhouse it is reworked into heat. But the warm interior radiate the
infrared. Such can not escape through the glass.
In the result my greenhouse stays hot on a sunny day.

Hello Jeff.

I am now checking the front of my camera lens. Yes - there's a UV filter on
it. Wonder why?

Best wishes, Ian.

I heard a good one on the radio the other day. A fellow was describing a dipole and he was feeding it with parallel lines of rg8x to keep it in balance. Then into a tuner.

That did not bother me, but what made my ears perk up is that he cut the dipole either longer or shorter (forgot which) so the SWR was about 2.5 to 3 to 1. By doing this he said the signal to noise ratio was a lot beter on receive.

Or you can turn down the RF gain and accomplish the same thing on receive
but not effect transmit.

I think you missed the point.

USING a SWR meter to tune a antenna does nothing to express resonance.

Dipoles by nature are a 1/2 wavelength or wavelengths in size.

The RG 8X was used as phasing lines - was the tuneable matching
network.

Maybe what the person intended to say was that they tuned the antenna
for a different frequency / hence at the frequency they desired to use,
was a poor match with that antenna.

It stands to reason, if the antenna was not resonant, it would not
receive as well at X Mhz.

In communications, we want to receive as much as we can possibly
receive, unless what you are trying to do is local communications into
the one local repeater - since most public service communications takes
place on one frequency or one band of frequencies. Police, Fire,
Ambulance etc...

When tropospheric ducting takes place, it is not uncommon to hear others
communicating on your frequency, even if they are hundreds of miles away
- even on 450 MHz...

You did not answer the question. I will restate it.

How can a wire that is completely insulated with respect to electrons
radiate an RF signal?

An additional question.

Since radio waves, according to you, are made up of electrons, how do
radios receive and transmit inside building which are made of insulating
and nonconducting glass and concrete?

Things went well. The "crew" was available the evening before FD and the antenna went up easily. I had 30 feet of 1 1/2" PVC pipe, guyed at every 10 feet. The quad, hung in a diamond configuration, dangled to within a few feet of the ground when the corners were tethered out. We were on the shore of San Diego Bay.

The driven element was cut a little large, so I trimmed about a foot in small increments to bring it in-band. The antenna analyzer said it had a 39 ohm impedance and I got about a 2.1:1 VSWR at the radio (TS-870), whose internal tuner made a match in a second or two.

It performed quite well. 20m screamed all day and into the evening. I had contacts all over the US, including Hawaii off the back of the antenna. I was surprised to hear and work the East Coast well into the night. I got Delaware and South Florida at 1:00 AM Local.

We used N3FJP Field Day Logger 2.6 to collect the contacts. I provided an HP laptop running Windows XP as the server and we had a donated Netgear router at 8' to create a Wi-Fi network. I had a small generator for power and a UPS for the network when the generator needed refueling. I did NOT like staying awake all night babysitting that generator.

The network and the program performed almost perfectly. However, at 10:45 PM, 12 hours in, the server laptop screen went dark I almost had a heart attack. But then it began to display the screen saver. Aha! As soon as I rubbed the touchpad, the display came back.

Most of our eight stations held the network for the whole 24 hours. A couple of our stations dropped the network once or twice each for

unexplained reasons. They were able to reacquire the network and when they did, the program on their machines instantly accessed the logfile on the server and updated their displays, as expected.

One feature of this program is a map display, showing all the US states, Canada and parts of the Caribbean. The map starts out in B&W outline format but the outlines are colored-in, section-by-section as the sections are worked. Neat. I did notice that every minute, all the colors change on two of my computers. I haven't tried all of them -- yet. Is it a bug or an undocumented feature? :-)

No insulators to make a wire that is completely insulated with respect to
electrons. It is the material, thickness and frequency dependent.

>

Light (and radio waves) are made up of electrons, according to Faraday, L.
Lorentz, Tesla and Dirac.
The conductance is the frequency dependent.
The light travel in the glass fibre but do not travel in a copper wire.

EM waves are older than Tesla and Dirac:
"In the year 1884 Oliver Heaviside selected these four equations, and in
conjunction with Willard Gibbs, he put them into modern vector notation.
This gives rise to the claim by some scientists that Maxwell's equations are
in actual fact Heaviside's equations.
The matter is further confused by the fact that the term 'Maxwell's
Equations' is also used to describe a set of eight equations labelled (A) to
(H) in Maxwell's 1864 paper A Dynamical Theory of the Electromagnetic Field.
It therefore helps when referring to 'Maxwell's Equations' to specify
whether we are talking about the original eight equations or the modified
'Heaviside Four'.

Gauss's Law is the only equation that appears in both sets, however the
Maxwell/Amp&#65533;re equation in the 'Heaviside Four' is an amalgamation of two
equations in the original eight." From:
http://users.aims.ac.za/~franckm/Maxwell's_equations.html

The Heaviside's EM is usefull for the near-field.

The "far-field" is the oscillatory flow of electrons.

Faraday, L. Lorentz, Tesla and Dirac were ignorant?

S*.

Hello Szczepan. Please explain, in your own words, to help me understand
what you are trying to say, the meaning of
"near-field",
"far-field" and
"oscillatory flow of electrons". No quoting from web pages or books.

Kindest regards, Ian.

Yes, indeed, they were ignorant of the standard model of quantum physics but they had a good excuse for their ignorance. What is your excuse?:)

In 1867 Lorenz wrote: " Ludvig Valentin Lorenz, "On the identity of the
vibrations of light with
electrical currents," Philosophical Magazine, Vol. 34, 1867, p. 287-301"

http://books.google.pl/books?id=caJdQfAKHtMC&hl=pl&pg=RA1-PA287#v=onepage&q&f=false

On p. 301 he wrote:
"The present general opinion regards light as consisting of backward and
forward motions of particles of aether."
If this were the case the electrical current would be the progressive motion
of the aether in the direction of the electrical current."

In today's words: "Light is the oscillatory flow of electrons".

Each wave is the oscillatory flow:
"Stokes drift may occur in all instances of oscillatory flow which are
inhomogeneous in space."
From: http://en.wikipedia.org/wiki/Stokes_drift

The " backward and forward motions of particles" are always not simmetric.
The forward is always stronger.

Hello Szczepan .
I see you aren't able to explain "oscillatory flow of electrons" in your
own words.
With " backward and forward motions of particles" I would have asked
"backwards and forwards relative to what" but I suspect that you can't
explain this in your own words.

The aether drift theory was disproven in 1905 (as published by
Michelson and Morley):
<http://en.wikipedia.org/wiki/Michelson-Morley_experiment>
<http://en.wikipedia.org/wiki/Luminiferous_aether>

Oops. The 1905 date should be 1887.

>Actually, Jeff, I don't think it was disproven. In what world do you
>maintain that lack of evidence is proof of non-existance?

Yeah, I know. Absense of proof is not proof of absensce. At the
time, it was much like dark matter. There's plenty of evidence to
suggest that it might exist, but no experimental proof.

Many scientists have produced results both postive and "lack of
evidence" for the aether drift along the way. Michelson Morley was
the first reproducable test that failed to show the existence of a
luminiferous aether wind, thus suggesting that it might be rubbish.

>(By the way, I'm on their side.)

Plenty of sides to choose from. Today, the consensus is that there is
no aether wind:
<http://en.wikipedia.org/wiki/Timeline_of_luminiferous_aether>
However, if it did exist, it might help explain why I can hear a DX
station, but they never seem to hear me. Asymmetrical skip perhaps?
My signal goes easier or farther downwind?

It is not a lack of evidence.

It is that the abudant evidence does not support the existance of an aether.

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

Michelson disproved the H.Lorentz aether;
"It appears, from all that precedes, reasonably certain that if there be any
relative motion between the earth and the luminiferous ether, it must be
small; quite small enough entirely to refute Fresnel's explanation of
aberration. Stokes has given a theory of aberration which assumes the ether
at the earth's surface to be at rest with regard to the latter, and only
requires in addition that the relative velocity have a potential; but
Lorentz shows that these conditions are incompatible. Lorentz then proposes
a modification which combines some ideas of Stokes and Fresnel, and assumes
the existence of a potential, together with Fresnel's coefficient. If now it
were legitimate to conclude from the present work that the ether is at rest
with regard to the earth's surface, according to Lorentz there could not be
a velocity potential, and his own theory also fails."
From:
http://en.wikisource.org/wiki/On_the_Relative_Motion_of_the_Earth_and_the_Luminiferous_Eth
er

The Michelson proved that Stokes aether rotate with the Sun (1887) but not
rotate with the Earth (1925).

Did not you read:
"1925 - the Michelson-Gale-Pearson experiment produces a positive result
while attempting to detect the effect of Earth's rotation on the velocity of
light. The significance of the experiment remains debated to this day, but
this planetary Sagnac effect is measured by ring laser gyros and taken into
account by the GPS system."

In 1925 Michelson and Gale did show that there is the aether wind caused by
the Earth rotation.

"More generally, the Stokes drift velocity is the difference between
theaverage Lagrangian flow velocity of a fluid parcel, and the
averageEulerian flow velocity of the fluid at a fixed position. This
nonlinearphenomenon is named after George Gabriel Stokes, who derived
expressions for this drift in his 1847 study of water waves."

Hi Irv.

It's fun.It leads to some good discussions between the amateurs on this group.

It's akin to trying to explain amateur radio to a friend. The difference is that friends usually listen and understand whereas S* is a "copy-and-paste practitioner" and can't understand.

73, Ian.

Ah! The humour of it all. I'm now trying to work out if Szczepan floats above the ground or keeps his feet firmly anchored in it.
Let's remember that, to him, a transmitter is a black box and that he really doesn't understand that of which he writes. I do like the way he's moaned about aerials having to be grounded and now has decided that the ground can be different for Tx and Rx.

I have to acknowledge that this group has made me smile more than some of the comedy shows on BBC Radio 4 Extra.

73 to all, Ian.

In Tx the huge amount of electrons must jump off the antenna. They flow from
the big ground.
In Rx only a few electrons enters in antenna and flow to a little ground.

The technical discussion on this group has dropped down in the past
year. It is nice to see a renewal of activity, even if some of the
posts are controversial.

However, I personally lose interest when the discussions are
nonsensical.

You probably would not notice anything on 80 meters. It is possiable that
the wire not being insulated and a differant size will cause a slight shift
in the resonate frequency, but I doubt that you will notice it.
It is sort of like having a truck load of bricks. If you add one more
brick, there is an effect, just too slight to make any differance. Unless
someone told you the brick was added, you would not notice it.

Hi
Interesting question.
As the others I don't think anything useful will happen.
In such cases it is convenient to put the things to their limits.
Imagine the diameter of one half is infinite.
You now have a quarter wave over a ground plane.A well known case.
Impedance is halved .
Resonnance is only dependant of the remaining wire and unchanged.
Your result should be somewhere between no change and that.
Another similar question :
Instead of burying lots of radials at the base of a vertical
what about digging (or using) a well and having a quarter wave of wire
dropped into it ?

The resonance will change because of the conductivity of the copper wire
vs the copper clad wire.
Although the electrons travels on the outside (skin) of the wire, the
core still plays a part in the equasion because the resistance changes
with the materials.

No effect. The bandwidth of the antenna is determined by the diameter
of the conductor. The wider the conductor, the greater the bandwidth.
The difference between 18 and 20AWG is negligible and has no effect.

However, 18AWG copper wire is not going to support itself for very
long. Copper is soft and breaks easily. The weight of the center
balun, plus the coax weight, plus any birds that might roost on the
wire, are going to break it. Please consider using heavier gauge
wire, copperweld, or at least support the center balun.

As I vaguely recall, NEC (National Electrical Code) Section 810
suggests 14AWG minimum for antennas. I'm too lazy to find the chapter
and verse.

My favorite antenna wire is stainless steel fishing line. Very strong
and doesn't rust. The problem is that as soon as I buy a roll, one of
the local hams invents an antenna project that consumes the entire
roll.

A real well in soil will be the perfect infinite source of electrons.
The well in a dry rock will be most wrong.

The well in the dry rock is used in ULF. But the electrons are pumped from
the wet area.

A source of electrons is not required. Transmitters use AC (alternating current) so there is no net flow of electrons.

AC is in a transformer.
In an antenna is the oscillatory flow of electrons. So there is the net
flow of electrons.

"It is now known that this device operated by emitting electrons from the
single electrode through a combination of field electron emission and
thermionic emission.[citation needed] Once liberated, electrons are strongly
repelled by the high electric field near the electrode during negative
voltage peaks from the oscillating HV output of the Tesla Coil"

Do not you know that?

If that were true, there would be a DC current into a transmitting antenna
fed only by HF (AC) current.
But of course there is no such DC current. If it were there, it would
mean there is nonlinearity in the antenna and there would be severe
intermodulation.

Szczepan seems to be muddling up valves and aerials. I guess there's no point in trying to explain the difference between the two to him. Didn't he make a similar posting a few months ago?

73, Ian.

He has been posting his idiotic crap for years and years both here and in
sci.phyics.electromag.

No matter what you tell him his response will be a pile of babbling word
salad like the above and a reference to something written over a hundred
years ago and perhaps a misinterpreted link to a Wiki article about
something else that has some similar words in it.

References to textbooks mean nothing to him as he believes all "teachers"
are in a conspiracy to hide the truth.

He thinks Feynman was a "teacher" and not credible.

Yeah, Feynman was a teacher like Mozart was a piano player.

Jim, he is either just having a big laugh by posting all this babbling
and watching our reaction or he has a some form of mental illness. If
the later, he is unaware that he has lost touch with reality.

It is probably a form of therapy to cut and paste all the little pieces
of documents he finds. It may make him feel like he has answers that
none of the rest of us have. The clear evidence that he is confusing
valves and antennas is one of the endless indications of his ignorance
of electrical theory.

He continues his babbling because he gets a huge amount of attention
from it. He has an answer for everything. It is just that the answers
make no sense and are rarely related to the questions.

However, if his babblings make sense to anyone, I have and electron
bridge that is securely attached to the earth. It allows perfect radio

communications anywhere in the universe. I am willing to sell this bridge at a discount price. Please contact me for pricing and delivery.

Michael

I'm headed that way, myself. This FD was no fun. I used to look forward to it.

I was so busy making sure that I met all my responsibilities, I found only a few hours to actually operate. This came after all the prep work, worry and concern, including getting an all-electronic network log running. (That our network logging worked perfectly in no way makes up for my having had trouble sleeping for weeks leading up to FD.)

Next year, this job goes to somebody else.

FD can be a lot of work. I know dragging a tower and beam
out there got to be a tad strenuous.
And I rarely used the thing myself..
I string up dipoles for me, which is pretty easy to deal with.
But even with an easy setup, I still don't care for contest
type operating all that much. Just not really my cup of java..
I skipped this year again. Too busy with work, even if I wanted
to go.
If I do any more in the future, like I say, I'll probably just
hang out on my own property. That way I can operate at a leisurely
pace, and if I get burned out, I can just quit and go do something
else for a while.

1630. Re: SWR and noise reduction

I doubt it.. He seems to be feeding a single dipole, using
twin runs of coax as an expensive type of ladder line. :/

It would almost surely be a matching issue though. The length
of the dipoles, or being resonant or not, doesn't really matter
too much. Almost any length dipole will radiate almost all
power applied to it. The trick is getting the power to it, and
not turning some into heat in the process.
And reception is reciprocal vs transmit.
I don't buy the claims of better signal to noise ratio.
Adding loss is going to lower the level of all received RF equally.
Actual signals will be reduced at the same ratio as any noise.
So at the end of the day, the s/n ratio should stay the same.

1631. 4145 Solution manuals to Mechanics, Mechanical Engineering and Aerospace Engineering Books

List of Solutions Manuals and Test Banks

---

contact to : mattosbw1@gmail.com mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

I do not review the forums, just send me an email. Please do not use emails from servers "LIVE" , all they are take as spam emails in my inbox.

- Mechanics, Mechanical Engineering & Aerospace Engineering:

Solution Manual Classical Mechanics (Douglas Gregory)
Solution Manual Classical Mechanics : From Newton to Einstein : A Modern Introduction (2nd Ed., Martin McCall)
Solution Manual Advanced Dynamics (Donald T. Greenwood)
Solution Manual Principles of Dynamics (2nd Ed., Donald T. Greenwood)
Solution Manual Advanced Engineering Dynamics (2nd Ed., Jerry Ginsberg)
Solution Manual Classical Dynamics (Jorge V. José)
Solution Manual Impact Mechanics (W.J. Stronge)
Solution Manual Human Body Dynamics (Aydin Tozeren)
Solution Manual Statistical Mechanics (2nd Ed., R.K. Pathria)
Solution Manual Statistical Mechanics (3rd Ed., R.K. Pathria & Paul D. Beale)
Solution Manual Engineering Mechanics of Solids (2nd Ed., Egor P. Popov)
Solution Manual Introduction to Continuum Mechanics (4th Ed., W. Michael Lai, David Rubin & Erhard Krempl)
Solution Manual Analytical Mechanics (7th Ed., Grant R. Fowles, George Cassiday)
Solution Manual Introduction to Mechanical Engineering (Rizza)
Solution Manual Engineering Fundamentals and Problem Solving (4th Ed., Eide, Jenison, Mashaw & Northup)
Solution Manual Engineering Fundamentals and Problem Solving (5th Ed., Eide, Jenison, Northup & Mickelson)
Solution Manual Engineering Fundamentals and Problem Solving (6th Ed., Eide, Jenison, Northup & Mickelson)
Solution Manual Mechanical Engineering Principles (Bird & Ross)
Solution Manual Dynamics of Mechanical Systems (C.T.F. Ross)
Solution Manual Mechanics of Solids (C.T.F. Ross)
Solution Manual Introduction to Engineering Analysis (1st Ed., Hagen)

Solution Manual Introduction to Engineering Analysis (2nd Ed., Hagen)
Solution Manual Introduction to Engineering Analysis (3rd Ed., Hagen)
Solution Manual Engineering Design (Rudolph J. Eggert)
Solution Manual Creative Design of Products and Systems (Saeed Niku)
Solution Manual Fundamentals of Engineering Design (2nd Ed., Barry Hyman)
Solution Manual Engineering Design (4th Ed., George Dieter & Linda Schmidt)
Solution Manual Engineering Design (5th Ed., George Dieter & Linda Schmidt)
Solution Manual Engineering Design and Graphics with Autodesk Inventor 2009 (James Bethune)
Solution Manual Engineering Design : A Project-Based Introduction (2nd Ed., Clive Dym & Patrick Little)
Solution Manual Engineering Design : A Project-Based Introduction (3rd Ed., Clive Dym & Patrick Little)
Solution Manual Tools and Tactics of Design (Dominick, Demel, Lawbaugh, Freuler, Kinzel & Fromm)
Solution Manual Biofluid Mechanics - An Introduction to Fluid Mechanics, Macrocirculation, and Microcirculation (David Rubenstein, Wei Yin & Mary Frame)
Solution Manual Advanced Fluid Mechanics (William Graebel)
Solution manual Modern Fluid Dynamics (Clement Kleinstreuer)
Solution manual Essential Computational Fluid Dynamics (Oleg Zikanov)
Solution Manual Computational Fluid Dynamics : A Practical Approach (Jiyuan Tu, Guan Heng Yeoh & Chaoqun Liu)
Solution Manual Mechanics of Fluids (8th Ed., Massey)
Solution Manual Fluid Mechanics (5th Ed., Frank White)
Solution Manual Fluid Mechanics (6th Ed., Frank White)
Solution Manual Fluid Mechanics (7th Ed., Frank White)
Solution Manual Viscous Fluid Flow (3rd Ed., Frank White)
Solution Manual Statistical Thermodynamics (Normand Laurendeau)
Solution Manual Introductory Statistical Thermodynamics (Nils Dalarsson , Mariana Dalarsson & Leonardo Golubovic)
Solution Manual Thermodynamics and Heat Power (6th Ed., Kurt C. Rolle)
Solution Manual Modern Engineering Thermodynamics (Robert Balmer)
Solution Manual Introduction to the Thermodynamics of Materials (4th Ed. David Gaskell)
Solution Manual Introduction to Thermodynamics and Heat Transfer (2nd Ed., Yunus Cengel)
Solution Manual Thermal Design : Heat Sinks, Thermoelectrics, Heat Pipes, Compact Heat Exchangers, and Solar Cells (HoSung Lee)
Solution Manual Fundamentals of Thermal-Fluid Sciences (1st Ed., Yunus Cengel)
Solution Manual Fundamentals of Thermal-Fluid Sciences (2nd Ed., Yunus Cengel)
Solution Manual Fundamentals of Thermal-Fluid Sciences (3rd Ed., Yunus Cengel & Robert Turner)
Solution Manual Fundamentals of Thermal-Fluid Sciences (4th Ed., Yunus Cengel , Robert Turner & John Cimbala)
Solution Manual Thermodynamics : An Engineering Approach (5th Ed., Yunus Cengel)
Solution Manual Thermodynamics : An Engineering Approach (6th Ed., Yunus Cengel & Michael Boles)
Solution Manual Thermodynamics : An Engineering Approach (7th Ed., Yunus Cengel & Michael Boles)
Solution Manual Essentials of Fluid Mechanics : Fundamentals and Applications (1st Ed., Yunus Cengel, John Cimbala)
Solution Manual Fluid Mechanics (1st Ed., Yunus Cengel & John Cimbala)

Solution Manual Fluid Mechanics (2nd Ed., Yunus Cengel & John Cimbala)
Solution Manual Heat Tranfer (2nd Ed., Yunus Cengel)
Solution Manual Heat and Mass Transfer : A Practical Approach (3rd Ed., Yunus Cengel)
Solution Manual Heat and Mass Transfer : Fundamentals and Applications (4th Ed., Yunus Cengel & Afshin Ghajar)
Solution Manual Introduction to Fluid Mechanics (6th Ed., Robert Fox, Alan McDonald & Philip Pritchard)
Solution Manual Introduction to Fluid Mechanics (7th Ed., Robert Fox, Philip Pritchard & Alan McDonald)
Solution Manual Fox and McDonald's Introduction to Fluid Mechanics (8th Ed., Philip Pritchard)
Solution Manual Fluid Mechanics (5th Ed., Douglas)
Solution Manual Fluid Mechanics (3rd Ed., Kundu & Cohen)
Solution Manual Fluid Mechanics (4th Ed., Kundu & Cohen)
Solution Manual Fluid Mechanics (5th Ed., Kundu , Cohen & Dowling)
Solution Manual Elementary Fluid Mechanics (7th Ed., Street, Watters & Vennard)
Solution Manual Fluid Mechanics with Engineering Applications (10th Ed., Finnemore & Franzini)
Solution Manual Fundamentals of Fluid Mechanics (4th Ed., Bruce Munson, Donald Young, Theodore Okiishi)
Solution Manual Fundamentals of Fluid Mechanics (5th Ed., Bruce Munson, Donald Young, Theodore Okiishi)
Solution Manual Fundamentals of Fluid Mechanics (6th Ed., Bruce Munson, Donald Young, Theodore Okiishi, Wade Huebsch)
Solution Manual Fundamentals of Fluid Mechanics - SI Units (6th Ed., Bruce Munson, Donald Young, Theodore Okiishi, Wade Huebsch)
Solution Manual Fundamentals of Fluid Mechanics (7th Ed., Bruce Munson, Theodore Okiishi, Wade Huebsch, Alric Rothmayer)
Solution Manual A Brief Introduction to Fluid Mechanics (3rd Ed., Donald Young, Bruce Munson, Theodore Okiishi)
Solution Manual A Brief Introduction to Fluid Mechanics (4th Ed., Donald Young, Bruce Munson, Theodore Okiishi, Wade Huebsch)
Solution Manual A Brief Introduction to Fluid Mechanics (5th Ed., Donald Young, Bruce Munson, Theodore Okiishi, Wade Huebsch)
Solution Manual Engineering Fluid Mechanics (7th Ed., Clayton Crowe, Donald Elger, John Roberson)
Solution Manual Engineering Fluid Mechanics (8th Ed., Clayton Crowe, Donald Elger, John Roberson)
Solution Manual Engineering Fluid Mechanics (9th Ed., Clayton Crowe, Donald Elger, John Roberson, Barbara Williams)
Solution Manual Engineering Fluid Mechanics - SI Version (9th Ed., Clayton Crowe, Donald Elger, John Roberson, Barbara Williams)
Solution Manual Fluid Mechanics (Potter & Foss)
Solution Manual Mechanics of Fluids (3rd Ed., Potter)
Solution Manual Fluid Power with Applications (7th Ed., Esposito)
Solution Manual Mechanics of Fluids (4th Ed., Shames)
Solution Manual Applied Fluid Mechanics (6th Ed., Mott)
Solution Manual Applied Fluid Mechanics - SI Units (6th Ed., Mott)
Solution Manual Hydraulic Control Systems (Noah Manring)
Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (5th Ed., S.L. Dixon)

Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (6th Ed., S.L. Dixon & Cesare Hall)
Solution Manual The Design of High-Efficiency Turbomachinery and Gas Turbines (2nd Ed., David Gordon Wilson & Theododios Korakianitis)
Solution Manual Fundamentals of Turbomachinery (William Peng)
Solution Manual Principles of Turbomachinery in Air-Breathing Engines (Baskharone)
Solution Manual Theory of Aerospace Propulsion (Pasquale Sforza)
Solution Manual Fundamentals of Jet Propulsion with Applications (Ronald D. Flack)
Solution Manual Extended Irreversible Thermodynamics (3rd Ed., D. Jou, J. Casas-Vazquez & G. Lebon)
Solution Manual Thermodynamics : An Integrated Learning System (Schmidt, Ezekoye, Howell & Baker)
Solution Manual Design of Fluid Thermal Systems (2nd Ed., William Janna)
Solution Manual Design and Simulation of Thermal Systems (N.V. Suryanarayana & Oner Arici)
Solution Manual Introduction to Thermal and Fluids Engineering (Kaminski & Jensen)
Solution Manual Heating, Ventilating and Air Conditioning Analysis and Design (6th Ed., McQuiston)
Solution Manual Heating, Ventilation, and Air Conditioning in Buildings (1st Ed., John W. Mitchell, James E. Braun)
Solution manual Heating and Cooling of Buildings : Design for Efficiency (2nd Ed., Jan Kreider, Peter Curtiss & Ari Rabl)
Solution Manual Electricity, Electronics, and Control Systems for HVAC (4th Ed., Thomas Kissell)
Solution Manual Heat and Mass Transfer (Anthony Mills)
Solution Manual Heat Transfer (2nd Ed., A.F. Mills)
Solution Manual Basic Heat and Mass Transfer (2nd Ed., A.F. Mills)
Solution Manual Convective Heat and Mass Transfer (4th Ed., Kays & Crawford)
Solution Manual Advanced Engineering Thermodynamics (3rd Ed., Bejan)
Solution Manual Convection Heat Transfer (3rd Ed., Bejan)
Solution Manual Design with Constructal Theory (Adrian Bejan & Sylvie Lorente)
Solution Manual Shape and Structure, from Engineering to Nature (Adrian Bejan)
Solution Manual Thermodynamics : Concepts and Applications (Stephen Turns)
Solution Manual Experimental Methods for Engineers (8th Ed., Jack P. Holman)
Solution Manual Heat Transfer (10th Ed., Jack Holman)
Solution Manual Principles of Heat Transfer (Kaviany)
Solution Manual Heat Convection (Latif M. Jiji)
Solution Manual Fundamentals of Momentum, Heat and Mass Transfer (5th Ed., Welty)
Solution Manual Analytical Methods for Heat Transfer and Fluid Flow Problems (Bernhard Weigand)
Solution Manual An Introduction to Fluid Dynamics : Principles of Analysis and Design (Stanley Middleman)
Solution Manual An Introduction to Mass and Heat Transfer : Principles of Analysis and Design (Stanley Middleman)
Solution Manual Fundamentals of Thermodynamics (5th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (6th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (7th Ed., Claus Borgnakke & Richard Sonntag)
Solution Manual Introduction to Engineering Thermodynamics (1st Ed., Richard Sonntag &

Claus Borgnakke)
Solution Manual Introduction to Engineering Thermodynamics (2nd Ed., Richard Sonntag & Claus Borgnakke)
Solution Manual Fundamentals of Engineering Thermodynamics (5th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics - SI Units (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (7th Ed., Michael Moran, Howard Shapiro, Daisie Boettner, Margaret Bailey)
Solution Manual Fundamentals of Heat and Mass Transfer (5th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Fundamentals of Heat and Mass Transfer (6th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Fundamentals of Heat and Mass Transfer (7th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Introduction to Heat Transfer (4th Ed., Incropera, DeWitt)
Solution Manual Introduction to Heat Transfer (5th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Introduction to Heat Transfer (6th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Radiation Detection and Measurement (3rd Ed., Glenn Knoll)
Solution Manual Radiation Detection and Measurement (4th Ed., Glenn Knoll)
Solution Manual Radiative Heat Transfer (2nd Ed., Michael Modest)
Solution Manual Principles of Combustion (2nd Ed., Kenneth Kuan-yun Kuo)
Solution Manual An Introduction to Combustion : Concepts and Applications (3rd Ed., Stephen R. Turns)
Solution Manual Combustion (2nd Ed., Irvin Glassman)
Solution Manual Combustion (3rd Ed., Irvin Glassman)
Solution Manual Combustion (4th Ed., Irvin Glassman)
Solution Manual Incompressible Flow (3rd Ed., Panton)
Solution Manual Modern Compressible Flow : With Historical Perspective (3rd Ed., John Anderson)
Solution Manual Non-Newtonian Flow : Fundamentals and Engineering Applications (R.P. Chhabra & J F Richardson)
Solution Manual Computational Techniques for Fluid Dynamics (Srinivas, K., Fletcher, C.A.J.)
Solution Manual Introduction to Computational Fluid Dynamics (A.W. Date)
Solution Manual Robot Modeling and Control (Spong, Hutchinson & Vidyasagar)
Solution Manual Introduction to Robotics : Mechanics and Control (3rd Ed., John J. Craig)
Solution Manual Introduction to Robotics: Analysis, Control, Applications (2nd Ed., Saeed B. Niku)
Solution Manual Theory of Applied Robotics : Kinematics, Dynamics and Control (Reza N. Jazar)
Solution Manual Control of Robot Manipulators in Joint Space (R. Kelly, V. Santibáñez, A. Loría)
Solution Manual Modelling and Control of Robot Manipulators (2nd Ed., Lorenzo Sciavicco, Bruno Siciliano)
Solution Manual Robotics : Modelling, Planning and Control (Bruno Siciliano, Lorenzo Sciavicco, Luigi Villani & Giuseppe Oriolo)

Solution Manual Fundamentals of Robotic Mechanical Systems : Theory, Methods, and Algorithms (3rd Ed., Jorge Angeles)
Solution Manual Kinematic Chains and Machine Components Design (Dan B. Marghitu)
Solution Manual Kinematics, Dynamics, and Design of Machinery (2nd Ed., Waldron & Kinzel)
Solution Manual Kinematics and Dynamics of Machinery (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Kinematics and Dynamics of Machinery - SI Units (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (3rd Ed., David H. Myszka)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (4th Ed., David H. Myszka)
Solution Manual Mechanism Design : Analysis and Synthesis (4th Ed., Erdman, Sandor & Kota)
Solution Manual Mechanical Design : A Components Approach (2nd Ed., Peter Childs)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (1st Ed., Collins)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (2nd Ed., Collins, Busby & Staab)
Solution Manual Fundamentals of Machine Component Design (3rd Ed., Juvinall)
Solution Manual Fundamentals of Machine Component Design (4th Ed., Juvinall & Marshek)
Solution Manual Fundamentals of Machine Component Design (5th Ed., Juvinall & Marshek)
Solution Manual Design of Machine Elements (8th Ed., Spotts)
Solution Manual Machine Elements in Mechanical Design (4th Ed., Mott)
Solution Manual Machine Elements in Mechanical Design - SI Units (4th Ed., Mott)
Solution Manual Mechanical Design : An Integrated Approach (1st Ed., Ansel Ugural)
Solution Manual Design of Machinery (3rd Ed., Norton)
Solution Manual Design of Machinery (4th Ed., Norton)
Solution Manual Design of Machinery (5th Ed., Norton)
Solution Manual Machine Design : An Integrated Approach (3rd Ed., Norton)
Solution Manual Machine Design : An Integrated Approach (4th Ed., Norton)
Solution Manual Mechanical Engineering Design (6th Ed., Shigley)
Solution Manual Mechanical Engineering Design (7th Ed., Shigley, Mischke & Budynas)
Solution Manual Shigley's Mechanical Engineering Design (8th Ed., Budynas & Nisbett)
Solution Manual Shigley's Mechanical Engineering Design (9th Ed., Budynas & Nisbett)
Solution Manual Fundamentals of Machine Elements (1st Ed., Hamrock)
Solution Manual Fundamentals of Machine Elements (2nd Ed., Hamrock)

Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (2nd Ed., Groover)
Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (3rd Ed., Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials, Processes, and Systems (3rd Ed., Mikell Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials, Processes, and Systems (4th Ed., Mikell Groover)
Solution Manual Introduction to Manufacturing Processes (Mikell Groover)
Solution Manual Materials and Processes in Manufacturing (9th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual DeGarmo's Materials and Processes in Manufacturing (10th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual DeGarmo's Materials and Processes in Manufacturing (11th Ed., J. T. Black, Ronald A. Kohser)
Solution Manual Principles of Metal Manufacturing Processes (Beddoes & Bibby)
Solution Manual Design for Manufacturing : A Structured Approach (Corrado Poli)
Solution Manual Fundamentals of Manufacturing (2nd Ed., Philip D. Rufe)

Solution Manual Engineering Materials Science (Milton Ohring)
Solution Manual Engineering Materials : Properties and Selection (8th Ed., Budinski)
Solution Manual Engineering Materials : Properties and Selection (9th Ed., Budinski)
Solution Manual Materials Science for Engineering Students (Traugott Fischer)
Solution Manual Essentials of Modern Materials Science and Engineering (James Newell)
Solution Manual Science and Design of Engineering Materials (2nd Ed., Schaffer, Saxena, et al)
Solution Manual Structure and Properties of Engineering Materiales (5th Ed., Daniel Henkel & Alan Pense)
Solution Manual Materials Selection in Mechanical Design (3rd Ed., Michael Ashby)
Solution Manual Materials Selection in Mechanical Design (4th Ed., Michael Ashby)
Solution Manual Materials : Engineering, Science, Processing and Design (1st Ed., Michael Ashby, Hugh Shercliff & David Cebon)
Solution Manual Materials : Engineering, Science, Processing and Design (2nd Ed., Michael Ashby, Hugh Shercliff & David Cebon)
Solution Manual Engineering Materials Vol. 1 : An Introduction to Properties, Applications and Design (3rd Ed., Michael Ashby & David Jones)
Solution manual Engineering Materials Vol. 1 : An Introduction to Properties, Applications and Design (4th Ed., Michael Ashby & David Jones)
Solution Manual Engineering Materials Vol. 2 : An Introduction to Microstructures, Processing and Design (3rd Ed., Michael Ashby & David Jones)
Solution Manual Materials Science and Engineering : An Introduction (6th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (7th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (8th Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (2nd Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (3rd Ed., William Callister)
Solution Manual Foundations of Materials Science and Engineering (3rd Ed, Smith)
Solution Manual Foundations of Materials Science and Engineering (4th Ed, Smith & Hashemi)
Solution Manual Foundations of Materials Science and Engineering (5th Ed, Smith & Hashemi)
Solution Manual Introduction to Materials Science for Engineers (6th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers (7th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers - International Edition (7th Ed., Shackelford)
Solution Manual Manufacturing Facilities Design and Material Handling (3rd Ed., Meyers & Stephens)
Solution Manual Manufacturing Facilities Design and Material Handling (4th Ed., Stephens & Meyers)
Solution Manual Technology Of Machine Tools (7th Ed., Steve F. Krar, Arthur R. Gill, Peter Smid)
Solution Manual Manufacturing Processes for Engineering Materials (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing Processes for Engineering Materials - SI Units (5th Ed. Kalpakjian, Smith & Chih-Wah Kok)
Solution Manual Manufacturing, Engineering & Technology (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing, Engineering & Technology (6th Ed. Kalpakjian & Smith)

Solution Manual Manufacturing, Engineering & Technology - SI Units (6th Ed. Kalpakjian & Smith)
Solution Manual Principles of Corrosion Engineering and Corrosion Control (Zaki Ahmad)
Solution Manual Steels : Microstructure and Properties (3rd Ed. Bhadeshia & Honeycombe)
Solution Manual Analysis and Performance of Fiber Composites (3rd Ed., Bhagwan Agarwal, Lawrence Broutman & K. Chandrashekhara)
Solution Manual Nanoengineering of Structural, Functional and Smart Materials (Mark Schulz, Ajit Kelkar, Mannur Sundaresan)
Solution Manual Applied Manufacturing Process Planning : With Emphasis on Metal Forming and Machining (Nelson, Schneider)
Solution Manual Mastering CAD/CAM (1st Ed., Ibrahim Zeid)
Solution Manual Principles of CAD/CAM/CAE (Kunwoo Lee)
Solution Manual Computer Numerical Control : Operation and Programming (3rd Ed., Stenerson & Curran)
Solution Manual Introduction to Computer Numerical Control (4th Ed., Valentino & Goldenberg)
Solution Manual Linear State-Space Control Systems (Robert L. Williams, II & Douglas A. Lawrence)
Solution Manual Gas Turbine Theory (6th Ed., H.I.H. Saravanamuttoo, G.F.C. Rogers, H. Cohen & Paul Straznicky)
Solution Manual Rocket Propulsion Elements (7th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Rocket Propulsion Elements (8th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Orbital Mechanics for Engineering Students (1st Ed., Howard Curtis)
Solution Manual Orbital Mechanics for Engineering Students (2nd Ed., Howard Curtis)
Solution Manual Atmospheric and Space Flight Dynamics : Modeling and Simulation with MATLAB and Simulink (Ashish Tewari)
Solution Manual Flight Dynamics Principles (2nd Ed., by Cook)
Solution Manual Mechanics of Flight (1st Ed., Warren F. Phillips)
Solution Manual Mechanics of Flight (2nd Ed., Warren F. Phillips)
Solution Manual Modern Flight Dynamics (David K. Schmidt)
Solution Manual Fundamentals of Airplane Flight Mechanics (David G. Hull)
Solution Manual Dynamics of Flight : Stability and Control (3rd Ed., Bernard Etkin & Lloyd Duff Reid)
Solution Manual Aircraft Rescue and Firefighting (5th Ed., IFSTA)
Solution Manual Aircraft Dynamics : From Modeling to Simulation (Marcello Napolitano)
Solution Manual Aircraft Propulsion (Saeed Farokhi)
Solution Manual Aircraft Performance (Maido Saarlas)
Solution Manual Design of Aircraft (Thomas C. Corke)
Solution Manual Flight Performance of Fixed and Rotary Wing Aircraft (Antonio Filippone)
Solution Manual Fundamentals Of Aircraft Structural Analysis (Howard Curtis)
Solution Manual Aircraft Control and Simulation (2nd Ed., Brian Stevens & Frank Lewis)
Solution Manual Aircraft Structures for Engineering Students (3rd Ed., T.H.G. Megson)
Solution Manual Aircraft Structures for Engineering Students (4th Ed., T.H.G. Megson)
Solution Manual Aircraft Structures for Engineering Students (5th Ed., T.H.G. Megson)
Solution Manual Aerodynamics for Engineering Students (6th Ed., E. L. Houghton, P. W. Carpenter, Steven Collicott, Dan Valentine)
Solution Manual Introduction to Aircraft Structural Analysis (T.H.G. Megson)
Solution Manual Mechanics of Aircraft Structures (2nd Ed, C. T. Sun)
Solution Manual Principles of Helicopter Aerodynamics (1st Ed., Leishman)
Solution Manual Fundamentals of Aerodynamics (2nd Ed., Anderson)

Solution Manual Fundamentals of Aerodynamics (3th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (4th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (5th Ed., Anderson)
Solution Manual Aerodynamics for Engineers (5th Ed., John Bertin & Russell Cummings)
Solution Manual Introduction to Flight (5th Ed., Anderson)
Solution Manual Introduction to Flight (6th Ed., Anderson)
Solution Manual Introduction to Flight (7th Ed., Anderson)
Solution Manual Mechatronics : Principles and Applications (Godfrey Onwubolu)
Solution Manual Mechatronics (Sabri Cetinkunt)
Solution Manual Introduction to Mechatronic Design (J. Edward Carryer, Matthew Ohline & Thomas Kenny)
Solution Manual Introduction to Mechatronics and Measurement Systems (2nd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (3rd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (4th Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Engineering Experimentation (2nd Ed., Wheeler & Ganji)
Solution Manual Introduction to Engineering Experimentation (3rd Ed., Wheeler & Ganji)
Solution Manual Gas Dynamics (3rd Ed., John & Keith)
Solution Manual Fundamentals of Gas Dynamics (2nd Ed, Robert D. Zucker)
Solution Manual Theory of Ground Vehicles (3rd Ed., J. Y. Wong)
Solution Manual Theory of Ground Vehicles (4th Ed., J. Y. Wong)
Solution Manual Vehicle Dynamics : Theory and Application (Reza Jazar)
Solution Manual Engineering Fundamentals of the Internal Combustion Engine (2nd Ed., Willard W. Pulkrabek)
Solution Manual Internal Combustion Engines : Applied Thermosciences (2nd Ed., Ferguson & Kirkpatrick)
Solution Manual Advanced Engine Performance Diagnosis (4th Ed., James Halderman)
Solution Manual Automotive Engines (8th Ed., Crouse)
Solution Manual Automotive Heating & Air Conditioning (5th Ed., Tom Birch)
Solution Manual Diagnosis and Troubleshooting of Automotive Electrical, Electronic, and Computer Systems (5th Ed., James Halderman)
Solution Manual Automotive Brake Systems Package (4th Ed., Rehkopf)
Solution Manual Automotive Brake Systems (4th Ed., Halderman)
Solution Manual Automotive Engine Performance (2nd Ed., Halderman)
Solution Manual Automotive Engines : Theory and Servicing (6th Ed., James Halderman)
Solution Manual Automotive Fuel and Emissions Control Systems (2nd Ed., James Halderman & James Linder)
Solution Manual Automotive Science and Mathematics (Allan Bonnick)
Solution Manual Automotive Mathematics (Jason Rouvel)
Solution Manual Automotive Service Management (Andrew Rezin)
Solution Manual Automotive Technology : Principles, Diagnosis, and Service (3rd Ed., Halderman)
Solution Manual Automotive Steering, Suspension, and Alignment (4th Ed., Halderman)
Solution Manual Automatic Transmissions & Transaxles (4th Ed., Tom Birch & Chuck Rockwood)
Solution Manual Hybrid and Alternative Fuel Vehicles (Halderman & Martin)
Solution Manual Manual Drivetrains and Axles (5th Ed., Birch & Rockwood)
Solution Manual Blueprint Reading for the Machine Trades (6th Ed., Schultz & Smith)
Solution Manual Modern Welding Technology (6th Ed., Cary & Helzer)

Solution Manual Tissue Engineering (Bernhard O. Palsson & Sangeeta N. Bhatia)
Solution Manual Tissue Engineering (Clemens van Blitterswijk, et al.)
Solution Manual Tissue Mechanics (Cowin, Doty)
Solution Manual Technology and Society (3rd Ed., Hjorth, Eichler, Khan & Morello)
Solution Manual BTEC First Engineering Curriculum Support Pack (Mike Tooley)
Solution Manual BTEC First Engineering (Mike Tooley)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (1st Ed., Philip Kosky, George Wise, Robert Balmer & William Keat)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (2nd Ed., Philip Kosky, Robert Balmer, William Keat & George Wise)
Solution Manual Engineering Science (5th Ed., W. Bolton)
Solution Manual Principles of Energy Conversion (2nd Ed., Archie W. Culp)
Solution Manual Fundamentals of Renewable Energy Processes (1st Ed., Aldo da Rosa)
Solution Manual Fundamentals of Renewable Energy Processes (2nd Ed., Aldo da Rosa)
Solution Manual Alternative Energy Systems (B. K. Hodge)
Solution Manual Modeling, Analysis and Optimization of Process and Energy Systems (F. Carl Knopf)
Solution Manual Solar Energy Engineering : Processes and Systems (Soteris Kalogirou)
Solution Manual Solar Engineering of Thermal Processes (2nd Ed., John Duffie & William Beckman)
Solution Manual Solar Engineering of Thermal Processes (3rd Ed., John Duffie & William Beckman)
Solution Manual Energy Technology and Directions for the Future (Fanchi)
Solution Manual Power Generation Technologies (Paul Breeze)
Solution Manual Foundations of Engineering (2nd Ed, Holtzapple & Dan Reece)
Solution Manual Industrial Mechanics and Maintenance (3rd Ed., Larry Chastain)
Solution Manual Mechanical and Electrical Equipment for Buildings (10th Ed., Stein, Reynolds, Grondzik, Kwok)
Solution Manual Mechanical and Electrical Equipment for Buildings (11th Ed., Grondzik, Kwok, Stein & Reynolds)
Solution Manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis & William Tao)
Solution Manual Engineering Drawing And Design (7th Ed., Jensen, Helsel & Short)
Solution Manual Pipe Drafting and Design (3rd Ed., Roy A. Parisher)
Solution Manual Autodesk Inventor (James M. Leake)
Solution Manual Engineering Design Graphics : Sketching, Modeling, and Visualization (1st Ed., James Leake & Jacob Borgerson)
Solution Manual Orthopaedic Biomechanics : Mechanics and Design in Musculoskeletal Systems (Donald Bartel, Dwight Davy & Tony Keaveny)
Solution Manual Science for Engineering (3rd Ed., John Bird)

1632. 4145 Solution manuals & Test Banks to Electrical, Electronics and Computer Engineering Books - part1

Newsgroup: rec.radio.amateur.antenna
Date: 2012-07-04 07:50:17 UTC
From: rodwes15@gmail.com
Message-ID: <f3ddac96-9f3f-4b6d-801c-9e0455b37bd7@googlegroups.com>
Source record: 1548

List of Solutions Manuals and Test Banks

----

contact to : mattosbw1@gmail.com mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

I do not review the forums, just send me an email. Please do not use emails from servers "LIVE" , all they are take as spam emails in my inbox.

- Electrical, Electronics & Computer Engineering :

Solution Manual Design for Electrical and Computer Engineers (J. Eric Salt & Robert Rothery)
Solution Manual Electrical Systems Design (Theodore R. Bosela)
Solution Manual Electrical Engineering : Concepts and Applications S.A. Reza Zekavat)
Solution Manual Electrical Engineering : Principles and Applications (3rd Ed., Hambley)
Solution Manual Electrical Engineering : Principles and Applications (4th Ed., Hambley)
Solution Manual Electrical Engineering : Principles and Applications (5th Ed., Hambley)
Solution Manual Electronics (2nd Ed., Hambley)
Solution Manual Foundations of Electric Circuits (J.R. Cogdell)
Solution Manual Foundations of Electric Power (J.R. Cogdell)
Solution Manual Foundations of Electronics (J.R. Cogdell)
Solution Manual Foundations of Electrical Engineering (2nd Ed., John R. Cogdell)
Solution Manual Essentials of Electrical and Computer Engineering (David V. Kerns, Jr., J. David Irwin)
Solution Manual Physics of Semiconductor Devices (Jean-Pierre Colinge, Cynthia A. Colinge)
Solution Manual Electronics and Communications for Scientists and Engineers (Martin Plonus)
Solution Manual Cryptography & Network Security (Behrouz A Forouzan)
Solution Manual Data Communications and Networking (3rd Ed., Behrouz A. Forouzan)
Solution Manual Data Communications and Networking (4th Ed., Behrouz A. Forouzan)
Solution Manual TCP/IP Protocol Suite (2nd Ed., Behrouz Forouzan)
Solution Manual TCP/IP Protocol Suite (3rd Ed., Behrouz Forouzan)
Solution Manual TCP/IP Protocol Suite (4th Ed., Behrouz Forouzan)
Solution Manual Local Area Networks (Behrouz A Forouzan)
Solution Manual Communication Systems : Analysis and Design (Harold P.E. Stern & Samy A. Mahmoud)

Solution Manual Introduction to Communication Systems (3rd Ed., Ferrell G. Stremler)
Solution Manual Introduction to Digital Communications (Michael B. Pursley)
Solution Manual Digital Communications : A Discrete-Time Approach (Michael Rice)
Solution Manual Introduction to Digital Communication (2nd Ed., Rodger E. Ziemer & Roger W. Peterson)
Solution Manual Introduction to Spread Spectrum Communications (Rodger E. Ziemer, Roger L. Peterson & David E. Borth)
Solution Manual Micro and Smart Systems (G. K. Ananthasuresh, K. J. Vinoy, S. Gopalakrishnan, K. N. Bhat, V. K. Aatre)
Solution Manual Analog Integrated Circuit Design (2nd Ed., Tony Chan Carusone, David A. Johns, Kenneth W. Martin)
Solution Manual Analog Integrated Circuits for Communication : Principles, Simulation and Design (2nd Ed., Donald Pederson & Kartikeya Mayaram)
Solution Manual Satellite Communications (2nd Ed, Pratt, Bostian, Allnutt)
Solution Manual Business Data Communications (Behrouz A Forouzan)
Solution Manual Logic and Computer Design Fundamentals (4th Ed., Mano & Kime)
Solution Manual Linear Robust Control (Michael Green, David J. N. Limebeer)
Solution Manual Adaptive Control (2nd Ed., Karl Johan Astrom, Bjorn Wittenmark)
Solution Manual Advanced Engineering Electromagnetics (2nd Ed., Constantine A. Balanis)
Solution Manual Digital Logic Circuit Analysis and Design (Victor P. Nelson, H. Troy Nagle, Bill D. Carroll, David Irwin)
Solution Manual Digital Control Engineering : Analysis and Design (M. Sami Fadali & Antonio Visioli)
Solution Manual Computer-Controlled Systems : Theory and Design (3rd Ed., Karl Johan Astrom & Bjorn Wittenmark)
Solution Manual Electric Circuits (7th Ed., Nilsson & Riedel)
Solution Manual Electric Circuits (8th Ed., Nilsson & Riedel)
Solution Manual Electric Circuits (9th Ed., Nilsson & Riedel)
Solution Manual Introductory Circuits for Electrical and Computer Engineering (James Nilsson, Susan Riedel)
Solution Manual Electromagnetic Noise and Quantum Optical Measurements (Hermann A. Haus)
Solution Manual Optical Fiber Communications (4th Ed., Gerd Keiser)
Solution Manual Fiber Optic Communications (5th Ed., Joseph C. Palais)
Solution Manual Electromagnetics (Branislav M. Notaros)
Solution Manual Electromagnetics for Engineers (Fawwaz T. Ulaby)
Solution Manual Fundamentals of Applied Electromagnetics (5th Ed., Fawwaz T. Ulaby)
Solution Manual Applied Electromagnetics : Early Transmission Lines Approach (Stuart Wentworth)
Solution Manual Fundamentals of Electromagnetics with Engineering Applications (Stuart Wentworth)
Solution Manual Electromagnetics for Engineers : With Applications to Digital Systems and Electromagnetic Interference (Clayton Paul)
Solution Manual MEMS & Microsystems : Design and Manufacture (1st Ed., Tai-Ran Hsu)
Solution Manual MEMS & Microsystems : Design, Manufacture, and Nanoscale Engineering (2nd Ed., Tai-Ran Hsu)
Solution Manual Probability and Statistics for Engineering and the Sciences (7th Ed., Jay L. DeVore)
Solution Manual Probability and Stochastic Processes : A Friendly Introduction for Electrical and Computer Engineers (2nd Ed., Roy Yates & David Goodman)
Solution Manual Process Systems Analysis and Control (3rd Ed. Donald Coughanowr, Steven

LeBlanc)
Solution Manual Fuel Cell Engines (Matthew M. Mench)
Solution Manual Fuel Cell Fundamentals (1st Ed., Ryan O'Hayre, et. al)
Solution Manual Fuel Cell Fundamentals (2nd Ed., Ryan O'Hayre, Whitney Colella, Suk-Won Cha, Fritz Prinz)
Solution Manual Control Systems Engineering (4th Ed., Norman Nise)
Solution Manual Control Systems Engineering (5th Ed., Norman Nise)
Solution Manual Control Systems Engineering (6th Ed., Norman Nise)
Solution Manual Automatic Control Systems (8th Ed., Benjamin C. Kuo, Farid Golnaraghi)
Solution Manual Automatic Control Systems (9th Ed., Farid Golnaraghi, Benjamin C. Kuo)
Solution Manual Basic Electricity for Industry : Circuits and Machines - Canadian Edition (Doug Edgar)
Solution Manual Basic Engineering Circuit Analysis (8th Ed., Irwin & Nelms)
Solution Manual Basic Engineering Circuit Analysis (9th Ed., Irwin & Nelms)
Solution Manual Basic Engineering Circuit Analysis (10th Ed., Irwin & Nelms)
Solution Manual A Brief Introduction to Circuit Analysis (J. David Irwin)
Solution Manual Semiconductor Devices : Basic Principles (Jasprit Singh)
Solution Manual Semiconductor Device Fundamentals (Robert F. Pierret)
Solution Manual Advanced Semiconductor Fundamentals (2nd Ed., Robert F. Pierret)
Solution Manual Device Electronics for Integrated Circuits (3rd Ed., Richard S. Muller, Theodore I. Kamins)
Solution Manual Fundamentals of Semiconductor Devices (Anderson)
Solution Manual Scientific Computing (2nd Ed., Michael T. Heath)
Solution Manual System Identification : An Introduction (Karel J. Keesman)
Solution Manual Scientific Computing with Case Studies (Dianne P. O'Leary)
Solution Manual Pattern Recognition and Machine Learning (Christopher M. Bishop)
Solution Manual Modern Semiconductor Devices for Integrated Circuits (Chenming C. Hu)
Solution Manual Analysis and Design of Analog Integrated Circuits (4th Ed., Paul Gray, et al.)
Solution Manual Analysis and Design of Analog Integrated Circuits (5th Ed., Paul Gray)
Solution Manual Analysis and Design of Digital Integrated Circuits (3rd Ed., Hodges)
Solution Manual Introduction to Electric Circuits (6th Ed., Dorf & Svoboda)
Solution Manual Introduction to Electric Circuits (7th Ed., Dorf & Svoboda)
Solution Manual Introduction to Electric Circuits (8th Ed., Dorf & Svoboda)
Solution Manual Modulation, Detection and Coding (Tommy Öberg)
Solution Manual Principles of Communications: Systems, Modulation, and Noise (5th Ed., R.E. Ziemer & W.H. Tranter)
Solution Manual Principles of Communications (6th Ed., R.E. Ziemer & W.H. Tranter)
Solution Manual The Analysis and Design of Linear Circuits (4th Ed, Thomas & Rosa)
Solution Manual The Analysis and Design of Linear Circuits : Laplace Early (4th Ed, Thomas & Rosa)
Solution Manual The Analysis and Design of Linear Circuits (5th Ed, Thomas)
Solution Manual The Analysis and Design of Linear Circuits (6th Ed, Thomas, Rosa & Toussaint)
Solution Manual The Analysis and Design of Linear Circuits (7th Ed, Thomas, Rosa & Toussaint)
Solution Manual Dynamic Modeling and Control of Engineering Systems (2nd Ed., J. Lowen Shearer, Bohdan Kulakowski, John Gardner)
Solution Manual Modern Control Systems (11th Ed., Dorf & Bishop)
Solution Manual Modern Control Systems (12th Ed., Dorf & Bishop)
Solution Manual System Dynamics (4th Ed., Katsuhiko Ogata)

Solution Manual System Dynamics (1st Ed., William Palm III)
Solution Manual System Dynamics (2nd Ed., William Palm III)
Solution Manual System Dynamics and Response (S. Graham Kelly)
Solution Manual System Dynamics for Engineering Students : Concepts and Applications (Nicolae Lobontiu)
Solution Manual Optimal Control (2nd Ed., Frank Lewis & Vassilis Syrmos)
Solution Manual Optimal Control Theory : An Introduction (Donald E. Kirk)
Solution Manual Power Electronics (1st Ed., Daniel W. Hart)
Solution Manual Power Electronic Circuits (Issa Batarseh)
Solution Manual Power Electronics : Circuits, Devices and Applications (3rd Ed., Muhammad H. Rashid)
Solution manual Power Electronics : A First Course (Ned Mohan)
Solution Manual Power Electronics : Converters, Applications, and Design (3rd Ed., Ned Mohan, Tore Undeland & William Robbins)
Solution Manual Electric Power Systems : A First Course (Ned Mohan)
Solution Manual Electric Machines and Drives : A First Course (Ned Mohan)
Solution Manual Intuitive Probability and Random Processes using MATLAB (Steven Kay)
Solution Manual Signals and Systems using MATLAB (Luis Chaparro)
Solution Manual Analog Signals and Systems (Erhan Kudeki & David C. Munson, Jr.)
Solution Manual Continuous and Discrete Time Signals and Systems (Mrinal Mandal, Amir Asif)
Solution Manual Digital Signal and Image Processing (Tamal Bose)
Solution Manual Digital Image Processing (2nd Ed., Rafael Gonzalez, Richard Woods)
Solution Manual DSP First : A Multimedia Approach (James H. McClellan, Ronald W. Schafer, Mark A. Yoder)
Solution Manual Discrete-Time Signal Processing (2nd Ed., Alan Oppenheim, Ronald Schafer, John Buck)
Solution Manual Discrete-Time Signal Processing (3rd Ed., Alan Oppenheim & Ronald Schafer)
Solution Manual Signal Processing First (James H. McClellan, Ronald W. Schafer, Mark A. Yoder)
Solution Manual Statistical Digital Signal Processing and Modeling (Monson Hayes)
Solution Manual Digital Signal Processing (Thomas J. Cavicchi)
Solution Manual Digital Signal Processing System Design : LabVIEW-Based Hybrid Programming (2nd Ed., Kehtarnavaz)
Solution Manual Digital Signal Processing (2nd Ed., Mitra)
Solution Manual Digital Signal Processing (3rd Ed., Mitra)
Solution Manual Digital Signal Processing (4th Ed., Mitra)
Solution Manual Digital Signal Processing (4th Ed., John G. Proakis, Dimitris K Manolakis)
Solution Manual Digital Signal Processing (Charles Schuler & Mahesh Chugani)
Solution Manual Digital Signal Processing : Fundamentals and Applications (Li Tan)
Solution Manual Digital Signal Processing : An Experimental Approach (Shlomo Engelberg)
Solution Manual Digital Signal Processing : System Analysis and Design (Paulo S. R. Diniz)
Solution Manual Digital Signal Processing : A Modern Introduction (Ashok Ambardar)
Solution Manual Engineering Optimization : Theory and Practice (4th Ed., Singiresu S. Rao)
Solution Manual Applied Optimization with MATLAB Programming (1st Ed., P. Venkataraman)
Solution Manual Applied Optimization with MATLAB Programming (2nd Ed., P. Venkataraman)
Solution Manual Introduction to Applied Optimization (2nd Ed., Urmila Diwekar)
Solution Manual Logic Synthesis and Verification Algorithms (Gary Hachtel & Fabio Somenzi)
Solution Manual Adaptive Filtering : Algorithms and Practical Implementation (3rd Ed., Paulo S. R. Diniz)
Solution Manual Introduction to Scientific Computation and Programming (Daniel T. kaplan)

Solution Manual Principles of Signal Detection and Parameter Estimation (Bernard C. Levy)
Solution Manual Electric Machines Analysis and Design Applying MatLab (Cathey)
Solution Manual Fundamentals of Electrical Engineering (Giorgio Rizzoni)
Solution Manual Principles and Applications of Electrical Engineering (4th Ed, Rizzoni)
Solution Manual Principles and Applications of Electrical Engineering (5th Ed, Rizzoni)
Solution Manual Fundamentals of Electric Circuits (2nd Ed., Alexander & Sadiku)
Solution Manual Fundamentals of Electric Circuits (3rd Ed., Alexander & Sadiku)
Solution Manual Fundamentals of Electric Circuits (4th Ed., Alexander & Sadiku)
Solution Manual MSP430 Microcontroller Basics (John Davies)
Solution Manual Programming Massively Parallel Processors : A Hands-on Approach (David Kirk & Wen-mei Hwu)
Solution Manual Embedded Systems and Software Validation (Abhik Roychoudhury)
Solution Manual Embedded Systems Design with Platform FPGAs : Principles and Practices (Ronald Sass, Andrew Schmidt)
Solution Manual Embedded DSP Processor Design : Application Specific Instruction Set Processors (Dake Liu)
Solution Manual Embedded Microcontrollers and Processor Design (Charles Greg Osborn)
Solution Manual Embedded System Design : A Unified Hardware/Software Introduction (Vahid & Givargis)
Solution Manual Embedded Microcomputer Systems : Real Time Interfacing (2nd Ed., Jonathan W. Valvano)
Solution Manual Introduction to Programming with C++ (2nd Ed., Y. Daniel Liang)
Solution Manual Matlab : A Practical Introduction to Programming and Problem Solving (Stormy Attaway)
Solution Manual Matlab : A Practical Introduction to Programming and Problem Solving (2nd Ed., Stormy Attaway)
Solution Manual Principles of Computer System Design : An Introduction (Jerome Saltzer & M. Frans Kaashoek)
Solution Manual The Illustrated Network : How TCP/IP Works in a Modern Network (Walter Goralski)
Solution Manual Electronic Design Automation : Synthesis, Verification, and Test (Laung-Terng Wang, Yao-Wen Chang & Kwang-Ting Cheng)
Solution Manual Digital Design (Frank Vahid)
Solution Manual Digital Design with RTL Design, Verilog and VHDL (2nd Ed., Frank Vahid)
Solution Manual Digital Logic Design Principles (Balabanian & Carlson)
Solution Manual Fundamentals of Logic Design (5th Ed., Charles H. Roth)
Solution Manual Real-Time Systems and Software (Alan Shaw)
Solution Manual Introduction to VLSI Circuits and Systems (John P. Uyemura)
Solution Manual Chip Design for Submicron VLSI : CMOS Layout & Simulation (John Uyemura)
Solution Manual Classical Electrodynamics (2nd Ed., John David Jackson)
Solution Manual Objects, Abstraction, Data Structures and Design : Using C++ (Elliot B. Koffman & Paul A. T. Wolfgang)
Solution Manual Objects, Abstraction, Data Structures and Design Using Java Version 5.0 (Elliot B. Koffman & Paul A. T. Wolfgang)
Solution Manual Computer Architecture and Organization : An Integrated Approach (Murdocca & Heuring)
Solution Manual Wiley Pathways Networking Basics (1st Ed., Ciccarelli, Faulkner, FitzGerald, Dennis & Miller)
Solution Manual Software Engineering : Principles and Practice (3rd Ed., Hans van Vliet)
Solution Manual Software Design : From Programming to Architecture (Eric Braude)

Solution Manual Software Engineering : An Object-Oriented Perspective (Eric Braude)
Solution Manual Software Engineering : Modern Approaches (2nd Ed., Eric Braude & Michael Bernstein)
Solution Manual Neural and Adaptive Systems : Fundamentals through Simulations (José Principe, Neil Euliano & W. Curt Lefebvre)
Solution Manual Fundamentals of Electronic Circuit Design (David J. Comer & Donald T. Comer)
Solution Manual Microelectronic Circuit Design (2nd Ed., Jaeger & Blalock)
Solution Manual Microelectronic Circuit Design (3rd Ed., Jaeger & Blalock)
Solution Manual Microelectronic Circuit Design (4th Ed., Jaeger & Blalock)
Solution Manual Introduction to Microelectronic Fabrication : Volume 5 of Modular Series on Solid State Devices (2nd Ed., Richard Jaeger)
Solution Manual Microelectronic Circuits (5th Ed., Adel S. Sedra, K. C. Smith)
Solution Manual VHDL for Engineers (Kenneth Short)
Solution Manual Fundamentals of Digital Logic with VHDL Design (1st Ed., Brown & Vranesic)
Solution Manual Fundamentals of Digital Logic with VHDL Design (2nd Ed., Brown & Vranesic)
Solution Manual Fundamentals of Digital Logic with VHDL Design (3rd Ed., Brown & Vranesic)
Solution Manual CMOS Analog Circuit Design (2nd Ed., Phillip E. Allen, Douglas R. Holberg)
Solution Manual Design of Analog CMOS Integrated Circuits (Behzad Razavi)
Solution Manual Design of Integrated Circuits for Optical Communications (Behzad Razavi)
Solution Manual Fundamentals of Microelectronics, Preliminary Edition (Behzad Razavi)
Solution Manual Fundamentals of Microelectronics (1st Ed., Behzad Razavi)
Solution Manual RF Microelectronics (2nd Ed., Behzad Razavi)
Solution Manual Design with Operational Amplifiers and Analog Integrated Circuits (3rd Ed., Sergio Franco)
Solution Manual Your UNIX : The Ultimate Guide (1st Ed., Sumitabha Das)
Solution Manual Your UNIX : The Ultimate Guide (2nd Ed., Sumitabha Das)
Solution Manual Microwave Engineering (Annapurna Das)
Solution Manual Microwave Engineering (3rd Ed., David M. Pozar)
Solution Manual Microwave Engineering (4th Ed., David M. Pozar)
Solution Manual Microwave and RF Design of Wireless Systems (David M. Pozar)
Solution Manual Introduction to Wireless Systems (P. M. Shankar)
Solution Manual Microwave Transistor Amplifiers : Analysis and Design (2nd Ed., Guillermo Gonzalez)
Solution Manual Control Systems (Madan Gopal)
Solution Manual A First Lab in Circuits and Electronics (Yannis Tsividis)
Solution Manual Power System Analysis : Analysis and Design (John Grainger)
Solution Manual Power Systems Analysis (2nd Ed., Hadi Saadat)
Solution Manual Power Systems Analysis and Design (4th Ed., J.Duncan Glover and Mulukutla S. Sarma)
Solution Manual An Introduction to Digital and Analog Communications (2nd Ed., Simon Haykin & Michael Moher)
Solution Manual Communication Systems (4th Ed., Simon Haykin)
Solution Manual Communication Systems (5th Ed., Simon Haykin)
Solution Manual Communication Systems (4th Ed., A. Bruce Carlson, Paul B. Crilly, Janet Rutledge)
Solution Manual Communication Systems (5th Ed., A. Bruce Carlson, Paul B. Crilly)
Solution Manual Signals and Systems (2nd Ed., Simon Haykin & Barry Van Veen)
Solution Manual Introduction to Computing Systems : From bits & gates to C & beyond (1st Ed., Patt and Patel)

Solution Manual Introduction to Computing Systems : From bits & gates to C & beyond (2nd Ed., Patt and Patel)
Solution Manual Elements of the Theory of Computation (2nd Ed., Lewis & Papadimitriou)
Solution Manual Introduction to Languages and the Theory of Computation (3rd Ed., John Martin)
Solution Manual Introduction to Languages and the Theory of Computation (4th Ed., John Martin)
Solution Manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis & William Tao)
Solution Manual Silicon VLSI Technology : Fundamentals, Practice, and Modeling (Plummer, Deal & Griffin)
Solution Manual Dynamic Electromagnetics (Paul Diament)
Solution Manual Engineering Electromagnetics (2nd Ed., Nathan Ida)
Solution Manual Engineering Electromagnetics (Kenneth Demarest)
Solution Manual Engineering Electromagnetics (Umran S. Inan & Aziz Inan)
Solution Manual Field and Wave Electromagnetics (1st Ed., David Cheng)
Solution Manual Fundamentals of Engineering Electromagnetics (David Cheng)
Solution Manual Database Design and Implementation (Edward Sciore)
Solution Manual Information Modeling and Relational Databases (2nd Ed., Terry Halpin & Tony Morgan)
Solution Manual Probability, Statistics, and Random Processes For Electrical Engineering (3rd Ed., Alberto Leon-Garcia)
Solution Manual Detection and Estimation Theory (Thomas Schonhoff & Arthur Giordano)
Solution Manual The Intel Microprocessors (8th Ed., Barry B. Brey)
Solution Manual Wireless Networking (Kumar, Manjunath & Kuri)
Solution Manual Wireless Communications : Principles and Practice (2nd Ed., Theodore S. Rappaport)
Solution Manual Digital Electronics and Design with VHDL (Volnei A. Pedroni)
Solution Manual System-on-Chip Test Architectures : Nanometer Design for Testability (Wang, Stroud & Touba)
Solution Manual Digital Design (Verilog) : An Embedded Systems Approach Using Verilog (Peter Ashenden)
Solution Manual Digital Design (VHDL) : An Embedded Systems Approach Using VHDL (Peter Ashenden)
Solution Manual Computer Organization and Design : The Hardware/Software Interface (3rd Ed., Patterson & Hennessy)
Solution Manual Computer Organization and Design : The Hardware/Software Interface (4th Ed., Patterson & Hennessy)
Solution Manual Fundamentals of Computer Organization and Design (Sivarama P. Dandamudi)
Solution Manual Wireless Communications & Networking (Vijay Garg)
Solution Manual Network Flows : Theory, Algorithms, and Applications (Ravindra K. Ahuja, Thomas L. Magnanti, James B. Orlin)
Solution Manual Network Analysis, Architecture, and Design (3rd Ed., James McCabe)
Solution Manual Computer Networks : A Systems Approach (4th Ed., Peterson & Davie)
Solution Manual Computer Networks ISE : A Systems Approach (4th Ed., Peterson & Davie)
Solution Manual Digital Design and Computer Architecture (David Harris & Sarah Harris)
Solution Manual Fault-Tolerant Systems (Israel Koren & C. Krishna)
Solution Manual Computer Architecture : Pipelined and Parallel Processor Design (Michael J. Flynn)
Solution Manual Computer Architecture : A Quantitative Approach (4th Ed., Hennessy &

Patterson)
Solution Manual High-Performance Embedded Computing : Architectures, Applications, and Methodologies (Wayne Wolf)
Solution Manual Pattern Recognition (3rd Ed., Theodoridis & Koutroumbas)
Solution Manual Pattern Recognition (4th Ed., Theodoridis & Koutroumbas)
Solution Manual Data Mining : Concepts and Techniques (2nd Ed., Han & Kamber)
Solution Manual Data Mining : Concepts and Techniques (3rd Ed., Han , Kamber & Pei)
Solution Manual Cyber Attacks : Protecting National Infrastructure, STUDENT EDITION (Edward Amoroso)
Solution Manual Distributed and Cloud Computing : From Parallel Processing to the Internet of Things (Kai Hwang , Jack Dongarra & Geoffrey Fox)
Test bank Making Media : Foundations of Sound and Image Production (3rd Ed., Jan Roberts-Breslin)
Solution Manual Commonsense Reasoning (Erik Mueller)
Solution Manual Introduction to Data Compression (3rd Ed., Khalid Sayood)
Solution Manual Programming Language Pragmatics (2nd Ed., Michael Scott)
Solution Manual Programming Language Pragmatics (3rd Ed., Michael Scott)
Solution Manual Computer Graphics for Java Programmers (2nd Ed., Leen Ammeraal & Kang Zhang)
Solution Manual Database Modeling and Design : Logical Design (4th Ed., Teorey, Lightstone & Nadeau)
Solution Manual Database Modeling and Design : Logical Design (5th Ed., Teorey, Lightstone, Nadeau & Jagadish)
Solution Manual Computers As Components : Principles of Embedded Computing System Design (1st Ed., Wayne Wolf)
Solution Manual Computers As Components : Principles of Embedded Computing System Design (2nd Ed., Wayne Wolf)
Solution Manual Virtual Machines : Versatile Platforms for Systems and Processes (Jim Smith & Ravi Nair)
Solution Manual Comprehensive Functional Verification : The Complete Industry Cycle (Wile, Goss & Roesner)
Solution Manual User Interface Design and Evaluation (Stone, Jarrett, Woodroffe & Minocha)
Solution Manual Network Algorithmics : An Interdisciplinary Approach to Designing Fast Networked Devices (George Varghese)
Solution Manual Data Modeling Essentials (3rd Ed., Simsion & Witt)
Solution Manual A Student Guide to Object-Oriented Development (Carol Britton & Jill Doake)
Solution Manual Routing, Flow, and Capacity Design in Communication and Computer Networks (Pioro & Medhi)
Solution Manual Knowledge Representation and Reasoning (Brachman & Levesque)
Solution Manual Communication Networking : An Analytical Approach (Anurag Kumar, D. Manjunath & Joy Kuri)
Solution Manual Principles and Practices of Interconnection Networks (Dally & Towles)
Solution Manual Game Physics (David Eberly)
Solution Manual Engineering a Compiler (Keith Cooper & Linda Torczon)
Solution Manual Constraint Processing (Rina Dechter)
Solution Manual Design Methods for Reactive Systems : Yourdon, Statemate, and the UML (R. J. Wieringa)
Solution Manual Temporal Data & the Relational Model (C.J. Date, Darwen & Lorentzos)
Solution Manual Java Made Simple (2nd Ed., P. K. McBride)
Solution Manual The Firmware Handbook (Jack Ganssle)
Solution Manual Optical Networks : A Practical Perspective (2nd Ed., Ramaswami & Sivarajan)

Solution Manual Optical Networks : A Practical Perspective (3rd Ed., Ramaswami, Sivarajan & Sasaki)
Solution Manual Usability Engineering : Scenario-Based Development of Human-Computer Interaction (Rosson & Carroll)
Solution Manual The Designer's Guide to VHDL (2nd Ed., Peter Ashenden)
Solution Manual Transactional Information Systems : Theory, Algorithms, and the Practice of Concurrency Control and Recovery (Weikum & Vossen)
Solution Manual Parallel Computer Architecture : A Hardware/Software Approach (Culler, Singh & Gupta)
Solution Manual Advanced Compiler Design and Implementation (Steven Muchnick)
Solution Manual Parallel Programming with MPI (Peter Pacheco)
Solution Manual An Introduction to Parallel Programming (Peter Pacheco)
Solution Manual Distributed Algorithms (Nancy Lynch)
Solution Manual Electrical and Electronic : Principles and Technology (3rd Ed., John Bird)
Solution Manual Electrical and Electronic : Principles and Technology (4th Ed., John Bird)
Solution Manual Electrical Circuit Theory and Technology (3rd Ed., John Bird)
Solution Manual Electrical Circuit Theory and Technology (4th Ed., John Bird)
Solution Manual Electronic Circuits : Fundamentals & Applications (3rd Ed., Mike Tooley)
Solution Manual A Practical Guide to SysML : The Systems Modeling Language (Friedenthal, Moore & Steiner)
Solution Manual Multidimensional Signal, Image, and Video Processing and Coding (John Woods)
Solution Manual Multidimensional Signal, Image, and Video Processing and Coding (2nd Ed., John Woods)
Solution Manual Bioelectrical Signal Processing in Cardiac and Neurological Applications (Leif Sörnmo & Pablo Laguna)
Solution Manual Foundations of Analog and Digital Electronic Circuits (Anant Agarwal & Jeffrey Lang)
Solution Manual Introduction to Linear Circuit Analysis and Modelling : From DC to RF (Luis Moura & Izzat Darwazeh)
Solution Manual Embedded Systems Architecture : A Comprehensive Guide for Engineers and Programmers (Tammy Noergaard)
Solution Manual Bioimpedance and Bioelectricity Basics (2nd Ed., Grimnes & Martinsen)
Solution Manual Simulation with Arena (5th Ed., Kelton, Sadowski & Swets)
Solution Manual Simulation Modeling and Analysis with ARENA (Tayfur Altiok & Benjamin Melamed)
Solution Manual The Visual Story : Creating the Visual Structure of Film, TV and Digital Media (2nd Ed., Bruce Block)
Solution Manual The Shut Up and Shoot Documentary Guide : A Down & Dirty DV Production (Anthony Artis)
Solution Manual Portable Video : ENG & EFP (5th Ed., Medoff & Fink)
Solution Manual Voice and Vision : A Creative Approach to Narrative Film and DV Production (Mick Hurbis-Cherrier)
Solution Manual Writing for Multimedia and the Web : A Practical Guide to Content Development for Interactive Media (3rd Ed., Timothy Garrand)
Solution Manual Developing and Maintaining a Design-Tech Portfolio : A Guide for Theatre, Film & TV (Rafael Jaen)
Solution Manual Producing for TV and Video : A Real-World Approach (Cathrine Kellison)
Solution Manual Producing for TV and New Media : A Real-World Approach for Producers (2nd Ed., Cathrine Kellison)

Solution Manual Placing Shadows : Lighting Techniques for Video Production (3rd Ed., Gloman & Tom LeTourneau)
Solution Manual Film Directing Fundamentals : See Your Film Before Shooting (3rd Ed., Nicholas Proferes)
Solution Manual Introduction to Media Production : The Path to Digital Media Production (3rd Ed., Musburger & Kindem)
Solution Manual Introduction to Media Production : The Path to Digital Media Production (4th Ed., Kindem & Musburger)
Solution Manual Directing the Documentary (5th Ed., Michael Rabiger)
Solution Manual Video Production Handbook (4th Ed., Gerald Millerson & Jim Owens)
Solution Manual Making Media : Foundations of Sound and Image Production (Jan Roberts-Breslin)
Solution Manual Prepare to Board! Creating Story and Characters for Animation Features and Shorts (Nancy Beiman)
Solution Manual Light and Lens : Photography in the Digital Age (Robert Hirsch)
Solution Manual The Radio Station : Broadcast, Satellite & Internet (7th Ed., Michael Keith)
Solution Manual Developing Story Ideas (2nd Ed., Michael Rabiger)
Solution Manual Radio Production Worktext : Studio and Equipment (5th Ed., Reese, Gross & Gross)
Solution Manual Broadcast News Writing, Reporting, and Producing (4th Ed., Ted White)
Solution Manual Problem Solving and Programming Concepts (7th Ed., Sprankle)
Solution Manual Problem Solving and Programming Concepts (8th Ed., Sprankle & Hubbard)
Solution Manual A Balanced Introduction to Computer Science (2nd Ed., David Reed)
Solution Manual Introduction to Computing and Programming with Java : A Multimedia Approach (Guzdial & Ericson)
Solution Manual Starting Out with Programming Logic and Design (Tony Gaddis)
Solution Manual Starting Out with Programming Logic and Design (2nd Ed., Tony Gaddis)
Solution Manual Tools For Structured and Object-Oriented Design (7th Ed., Bohl & Rynn)
Solution Manual Programming with Alice and Java (Lewis & DePasquale)
Solution Manual e-Business and e-Commerce How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto)
Solution Manual XML How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto, Ted Lin, Praveen Sadhu)
Solution Manual Python How to Program (Harvey M. Deitel, Paul J. Deitel, Jonathan P. Liperi Ben Wiedermann)
Solution Manual Perl How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto, D. C. McPhie)
Solution Manual C How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual C How to Program (5th Ed., Harvey & Paul Deitel)
Solution Manual C++ How to Program (6th Ed., Harvey & Paul Deitel)
Solution Manual Visual Basic.NET How to Program (2nd Ed., Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto)
Solution Manual Visual C++ 2008 How to Program (2nd Ed., Harvey & Paul Deitel)
Solution Manual Internet & World Wide Web : How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual Web Technologies : A Computer Science Perspective (Jeffrey C. Jackson)
Solution Manual Mastering the Internet, XHTML and JavaScript (2nd Ed., Ibrahim Zeid)
Solution Manual Weaving a Website : Programming in HTML, Java Script, Perl and Java (Susan Anderson-Freed)
Solution Manual Simply C++ : An Application-Driven Tutorial Approach (Harvey & Paul Deitel)

Solution Manual Visual C# 2005 How to Program (2nd Ed., Harvey & Paul Deitel)
Solution Manual Visual C# 2008 How to Program (3rd Ed., Harvey & Paul Deitel)
Solution Manual Visual C# 2010 How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual Simply C# : An Application-Driven Tutorial Approach (Harvey & Paul Deitel, Hoey & Yaeger)
Solution Manual Java : An Introduction to Problem Solving and Programming (4th Ed., Walter Savitch)
Solution Manual Java : An Introduction to Problem Solving and Programming (5th Ed., Savitch & Carrano)
Solution Manual Introduction to Computing and Programming with Java : A Multimedia Approach (Guzdial & Ericson)
Solution Manual Java How to Program (7th Ed., Harvey & Paul Deitel)
Solution Manual Java How to Program : Early Objects Version (8th Ed., Paul Deitel)
Solution Manual Java How to Program : Late Objects Version (8th Ed., Paul Deitel)
Solution Manual Java For Students (5th Ed., Bell & Parr)
Solution Manual Java, Java, Java, Object-Oriented Problem Solving (3rd Ed., Morelli & Walde)
Solution Manual Java : An Eventful Approach (Bruce, Danyluk & Murtagh)
Solution Manual Introduction to Java Programming with JBuilder (3rd Ed., Y. Daniel Liang)
Solution Manual Starting Out with Visual Basic 2008 (4th Ed., Gaddis & Irvine)
Solution Manual Starting Out with Visual Basic 2010 (5th Ed., Gaddis & Irvine)
Solution Manual Starting Out with Python (Tony Gaddis)
Solution Manual Object-Oriented Programming in Python (Goldwasser & Letscher)
Solution Manual Introduction to MathCAD 11 (Ronald W. Larsen)
Solution Manual Introduction to MathCAD 13 (2nd Ed., Ronald W. Larsen)
Solution Manual MatLAB Programming (David Kuncicky)
Solution Manual Introduction to Maple 8 (David Schwartz)
Solution Manual Introduction to FORTRAN 90 (2nd Ed., Larry R. Nyhoff & Sanford Leestma)
Solution Manual Fortran 95/2003 Scientists and Engineers (3rd Ed., Stephen J. Chapman)
Solution Manual Introduction to Java (Stephen J. Chapman)
Solution Manual Java Software Solutions for AP Computer Science A (2nd Ed., Lewis, Loftus & Cocking)
Solution Manual Business Data Networks and Telecommunications (6th Ed., Raymond R. Panko)
Solution Manual Business Data Networks and Telecommunications (7th Ed., Raymond R. Panko)
Solution Manual Business Data Communications (Allen Dooley)
Solution Manual Object-Oriented Programming in C++ (4th Ed., Robert Lafore)
Solution Manual C++ : Classes and Data Structures (Jeffrey Childs)
Solution Manual Data Structures Outside-In with Java (Sesh Venugopal)
Solution Manual Data Structures and Abstractions with Java (2nd Ed., Frank M. Carrano)
Solution Manual Data Structures and Algorithms in Java (Peter Drake)
Solution Manual Practical Introduction to Data Structures and Algorithm Analysis : C++ Edition (2nd Ed., Clifford A. Shaffer)
Solution Manual Computer Vision : A Modern Approach (David Forsyth & Jean Ponce)
Solution Manual Computer Graphics Using Java 2D and 3D (Hong Zhang & Y. Daniel Liang)
Solution Manual Computer Graphics Using OpenGL (3rd Ed., Francis Hill Jr. & Stephen Kelley)
Solution Manual Computer Graphics with OpenGL (3rd Ed., Donald Hearn & M. Pauline Baker)
Solution Manual User-Centered Web Site Development : A Human-Computer Interaction Approach (McCracken & Wolfe)
Solution Manual Fundamentals of Game Design (Ernest Adams & Andrew Rollings)
Solution Manual Introduction to The Game Industry (Moore & Sward)

Solution Manual Fundamentals of Math and Physics for Game Programmers (Wendy Stahler)
Solution Manual Usability Engineering : Process, Products & Examples (Laura Leventhal & Julie Barnes)
Solution Manual Web Usability : A User-Centered Design Approach (Jonathan Lazar)
Solution Manual Structured Computer Organization (5th Ed., Andrew S. Tanenbaum)
Solution Manual Assembly Language for Intel-Based Computers (5th Ed., Kip Irvine)
Solution Manual Assembly Language for x86 Processors (6th Ed., Kip R. Irvine)
Solution Manual Fundamentals of Multimedia (Ze-Nian Li & Mark Drew)
Solution Manual Digital Media Primer (Yue-Ling Wong)
Solution Manual Essentials for Design Macromedia Director MX 2004 Comprehensive (Tara Gray)
Solution Manual Modern Systems Analysis and Design (4th Ed., Jeffrey Hoffer, Joey George, & Joseph Valacich)
Solution Manual Modern Systems Analysis and Design (5th Ed., Jeffrey Hoffer, Joey George, & Joseph Valacich)
Solution Manual Modern Systems Analysis and Design (6th Ed., Jeffrey Hoffer, Joey George, & Joseph Valacich)
Solution Manual Modern Database Management (8th Ed., Hoffer, Prescott & Topi)
Solution Manual Modern Database Management (9th Ed., Hoffer, Prescott & Topi)
Solution Manual Modern Database Management (10th Ed., Hoffer, Ramesh & Topi)
Solution Manual Database Systems Using Oracle (2nd Ed., Nilesh Shah)
Solution Manual An Advanced Course in Database Systems : Beyond Relational Databases (Dietrich & Urban)
Solution Manual Data and Text Mining : A Business Applications Approach (Thomas Miller)
Solution Manual Network Management : Concepts and Practice, A Hands-On Approach (J. Richard Burke)
Solution Manual Computer and Communication Networks (Nader F. Mir)
Solution Manual High Performance TCP/IP Networking (Mahbub Hassan & Raj Jain)
Solution Manual Computer Security : Principles and Practice (William Stallings & Lawrie Brown)
Solution Manual Computer Forensics : Principles and Practices (Volonino, Anzaldua & Godwin)
Solution Manual Disaster Recovery : Principles and Practices (April Wells, Charlyne Walker & Timothy Walker)
Solution Manual Firewalls and VPNs : Principles and Practices (Richard Tibbs & Edward Oakes)
Solution Manual Network Defense and Countermeasures : Principles and Practices (Chuck Easttom)
Solution Manual Corporate Computer and Network Security (1st Ed., Raymond Panko)
Solution Manual Corporate Computer and Network Security (2nd Ed., Raymond Panko)
Solution Manual IP Telephony Using CallManager Express Lab Portfolio (Cheryl Schmidt & Ernie Friend)
Solution Manual High-Speed Networks and Internets : Performance and Quality of Service (2nd Ed., William Stallings)
Solution Manual Object-Oriented Modeling and Design with UML (2nd Ed., Michael Blaha & James Rumbaugh)
Solution Manual Operating Systems : Internals and Design Principles (5th Ed., William Stallings)
Solution Manual Operating Systems : Internals and Design Principles (6th Ed., William Stallings)

Solution Manual Distributed Systems : Principles and Paradigms (2nd Ed., Tanenbaum & Van Steen)
Solution Manual Modern Operating Systems (3rd Ed., Andrew Tanenbaum)
Solution Manual Computer Networks (4th Ed., Andrew S. Tanenbaum)
Solution Manual Computer Networks (5th Ed., Andrew S. Tanenbaum, David J. Wetherall)
Solution Manual Operating Systems Design and Implementation (3rd Ed., Andrew Tanenbaum & Albert Woodhull)
Solution Manual UNIX Unbounded : A Beginning Approach (5th Ed., Amir Afzal)
Solution Manual Introduction to Operating Systems and Networks (Ruth Watson)
Solution Manual Operating Systems (3rd Ed., Harvey Deitel, Paul Deitel & David Choffnes)
Solution Manual Operating Systems Principles (Lubomir Bic & Alan Shaw)
Solution Manual A Practical Guide to Linux : Commands, Editors, and Shell Programming (Mark Sobell)
Solution Manual A Practical Guide to Red Hat Linux : Fedora Core and Red Hat Enterprise Linux (2nd Ed., Mark Sobell)
Solution Manual A Practical Guide to Red Hat Linux : Fedora Core and Red Hat Enterprise Linux (3rd Ed., Mark Sobell)
Solution Manual A Practical Guide to Fedora and Red Hat Enterprise Linux: College Edition (Mark Sobell)
Solution Manual A Practical Guide to Ubuntu Linux (Mark Sobell)
Solution Manual Automata, Computability and Complexity : Theory and Applications (Elaine Rich)
Solution Manual Modern Digital Electronics (R.P. Jain)
Solution Manual Linear Systems and Signals (B.P. Lathi)
Solution Manual Modern Digital and Analog Communications Systems (3rd Ed., B. P. Lathi)
Solution Manual Introduction to Digital Systems (Milo D. Ercegovac, Lang & Moreno)
Solution Manual Embedded Systems : Architechture, Programming and Design (Raj Kamal)
Solution Manual Modern Power System Analysis (D. P. Kothari & I. J. Nagrath)
Solution Manual Basic Electrical Engineering (2nd Ed., D.P. Kothari, I.J. Nagrath)
Solution Manual Electric Machines (3rd Ed., D.P. Kothari, I.J. Nagrath)
Solution Manual Circuits and Networks (A. Sudhakar & S. Palli Shyammohan)
Solution Manual Electrical and Electronic Technology (9th Ed., Edward Hughes, John Hiley, Keith Brown & Ian McKenzie-Smith)
Solution Manual Electrical and Electronic Technology (10th Ed., Edward Hughes, John Hiley, Keith Brown & Ian McKenzie-Smith)
Solution Manual Electric Motors and Drives : Fundamentals, Types and Applications (3rd Ed., Austin Hughes)
Solution Manual Modern Processor Design : Fundamentals of Superscalar Processors (John P. Shen)
Solution Manual Computer Networks : Principles, Technologies and Protocols for Network Design (N. Olifer & V. Olifer)
Solution Manual Computer Networking : Internet Protocols in Action (Jeanna Matthews)
Solution Manual Computer Organization (5th Ed., Hamacher et al.)
Solution Manual CMOS Digital Integrated Circuits : Analysis and Design (3rd Ed., Sung-Mo Kang & Yusuf Leblebici)
Solution Manual Introduction to Logic Design (1st Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic Design (2nd Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic Design (3rd Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic and Computer Design (Alan B Marcovitz)
Solution Manual Digital Principles and Design (Donald D. Givone)

Solution Manual Programmable Logic Controllers (3rd Ed., Frank Petruzella)
Solution Manual Programmable Logic Controllers (4th Ed., Frank Petruzella)

1633. 4145 Solution manuals & Test Banks to Electrical, Electronics and Computer Engineering Books - part2

Newsgroup: rec.radio.amateur.antenna
Date: 2012-07-04 07:51:53 UTC
From: rodwes15@gmail.com
Message-ID: <19d7cd06-980b-43d6-af40-57e0b6738e07@googlegroups.com>
Source record: 1549

List of Solutions Manuals and Test Banks

---

contact to : mattosbw1@gmail.com mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

I do not review the forums, just send me an email. Please do not use emails from servers "LIVE" , all they are take as spam emails in my inbox.

- Electrical, Electronics & Computer Engineering :

Solution Manual Antenna Theory and Design (2nd Ed., Stutzman & Thiele)
Solution Manual Antennas for All Applications (3rd Ed., John Kraus & Ronald Marhefka)
Solution Manual Principles of Neurocomputing for Science and Engineering (Fredric M. Ham & Ivica Kostanic)
Solution Manual Introduction to Algorithms (2nd Ed., Cormen, et al.)
Solution Manual Algorithms (Dasgupta, et al.)
Solution Manual Introduction to Random Signals and Applied Kalman Filtering with Matlab Exercises (4th Ed., Robert Grover Brown, Patrick Y. C. Hwang)
Solution Manual Applied Operating Systems Concepts (Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts (6th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts (7th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts (8th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating Systems Concepts with Java (6th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts with Java (7th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts with Java (8th Ed., Silberschatz, Galvin & Gagne)
Solution Manual C++ Program Design (3rd Ed., Cohoon & Davidson)
Solution Manual Java : Program Design 5.0 (Cohoon & Davidson)
Solution Manual Programming in C++ : Lessons and Applications (Timothy B. D'Orazio)
Solution Manual Applied C : An Introduction and More (Alice Fischer)
Solution Manual Programming Languages : Principles and Paradigms (1st Ed., Allen Tucker & Robert Noonan)
Solution Manual Programming Languages : Principles and Paradigms (2nd Ed., Allen Tucker & Robert Noonan)
Solution Manual Introduction to Parallel Computing (2nd Ed., Grama, Karypis, Kumar & Gupta)
Solution Manual Parallel Programming in C with MPI and Open MP (Michael J Quinn)

Solution Manual Data Communications and Network Security (Houston H. Carr & Charles Snyder)
Solution Manual Data Communications and Networks (David Miller)
Solution Manual Management Information Systems (3rd Ed., Post & Anderson)
Solution Manual Management Information Systems (4th Ed., Post & Anderson)
Solution Manual Database Management Systems (3rd Ed. Post)
Solution Manual Management Information Systems (9th Ed., James A. O'Brien, George Marakas)
Solution Manual Introduction to Systems Analysis and Design (Whitten & Bentley)
Solution Manual Systems Analysis & Design : An Active Approach (2nd Ed., Marakas)
Solution Manual An Introduction to Object-Oriented Programming with Java (4th Ed., C. Thomas Wu - Otani)
Solution Manual An Introduction to Object-Oriented Programming with Java (5th Ed., C. Thomas Wu - Otani)
Solution Manual A Comprehensive Introduction to Object-Oriented Programming With Java (C. Thomas Wu)
Solution Manual Data Structures and the Java Collections Framework (1st Ed., William Collins)
Solution Manual Data Structures and the Java Collections Framework (2nd Ed., William Collins)
Solution Manual Data Structures and the Standard Template Library (William Collins)
Solution Manual Database System Concepts (4th Ed., Silberschatz)
Solution Manual Database System Concepts (5th Ed., Silberschatz)
Solution Manual Database System Concepts (6th Ed., Silberschatz, Korth & Sudarshan)
Solution Manual Database Management Systems (3rd Ed., Ramakrishnan & Gehrke)
Solution Manual Fundamentals of Network Security (Eric Maiwald)
Solution Manual Computing Concepts (1st Ed., Haag, et al.)
Solution Manual Computing Concepts (2nd Ed., Haag et al.)
Solution Manual Microsoft Office 2003 (Haag et al.)
Solution Manual Advanced Programming Using Visual Basic .NET (2nd Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Advanced Programming Using Visual Basic 2005 (3rd Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Programming with Java (Julia Case Bradley & Anita Millspaugh)
Solution Manual Programming in C#.Net (1st Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Programming in Visual C# 2005 (2nd Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Learning Programming Using Visual Basic.Net (Bill Burrows & Joe Lanford)
Solution Manual Programming in Visual Basic.NET : Visual Basic.NET 2005 (6th Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Programming in Visual Basic .Net : 2003 Update Edition (5th Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Survey of Operating Systems (2nd Ed., Jane Holcombe & Charles Holcombe)
Solution Manual Principles of Voice and Data Communications (Regis J. Bates & Marcus Bates)
Solution Manual Mike Meyers' Network+ Guide To Managing and Troubleshooting Networks (Michael Meyers)
Solution Manual Introduction to Windows Server 2003 (Eric Ecklund)
Solution Manual Programming The Web : An Introduction (Barrie Sosinsky & Valda Hilley)
Solution Manual Programming The Web Using XML (Ellen Pearlman & Eileen Mullin)
Solution Manual Internet Marketing : Building Advantage in a Networked Economy (2nd Ed., Rafi Mohammed et al.)
Solution Manual Internet Technologies at Work (Fred T. Hofstetter)

Solution Manual Internet Literacy (4th Ed., Fred T. Hofstetter)
Solution Manual Software Engineering : A Practitioner's Approach (5th Ed., Roger Pressman)
Solution Manual Software Engineering : A Practitioner's Approach (6th Ed., Roger Pressman)
Solution Manual Software Engineering : A Practitioner's Approach (7th Ed., Roger Pressman)
Solution Manual Web Engineering : A Practioner's Approach (1st Ed., Roger S. Pressman & David Lowe)
Solution Manual Object-Oriented Software Engineering (Stephen Schach)
Solution Manual Object-Oriented and Classical Software Engineering (5th Ed., Steve Schach)
Solution Manual Object-Oriented and Classical Software Engineering (6th Ed., Steve Schach)
Solution Manual Object-Oriented and Classical Software Engineering (7th Ed., Steve Schach)
Solution Manual Object-Oriented and Classical Software Engineering (8th Ed., Steve Schach)
Solution Manual Introduction to Object-Oriented Analysis and Design (Steve Schach)
Solution Manual Communication Networks (2nd Ed., Alberto Leon-Garcia & Indra Widjaja)
Solution Manual Fundamentals of Digital Logic with Verilog Design (1st Ed., Stephen Brown & Zvonko Vranesic)
Solution Manual Fundamentals of Digital Logic with Verilog Design (2nd Ed., Stephen Brown & Zvonko Vranesic)
Solution Manual Continuous and Discrete Control Systems (John Dorsey)
Solution Manual Engineering Circuit Analysis (6th Ed., William Hayt, Jack Kemmerly & Steven Durbin)
Solution Manual Engineering Circuit Analysis (7th Ed., William Hayt, Jack Kemmerly & Steven Durbin)
Solution Manual Engineering Electromagnetics (7th Ed., William Hayt & John Buck)
Solution Manual Engineering Electromagnetics (8th Ed., William Hayt & John Buck)
Solution Manual Principles of Electronic Materials and Devices (2nd Ed., Safa O. Kasap)
Solution Manual Principles of Electronic Materials and Devices (3rd Ed., Safa O. Kasap)
Solution Manual Programming in Haskell (Graham Hutton)
Solution Manual Probability and Random Processes With Applications to Signal Processing and Communications (Miller & Childers)
Solution Manual Logic in Computer Science : Modelling and Reasoning about Systems (2nd Ed., Michael Huth & Mark Ryan)
Solution Manual Introduction to Distributed Algorithms (2nd., Gerard Tel)
Solution Manual Information Theory, Inference and Learning Algorithms (David J. C. MacKay)
Solution Manual Digital Systems Engineering (William Dally & John Poulton)
Solution Manual Concepts in Programming Languages (by John Mitchell)
Solution Manual Simulation Modeling and Analysis (3rd Ed., Averill Law & David Kealton)
Solution Manual Simulation Modeling and Analysis with Expertfit Software (4th Ed., Averill Law)
Solution Manual System Modeling and Analysis : Foundations of System Performance Evaluation (Hisashi Kobayashi & Brian Mark)
Solution Manual Wireless Communications (Andrea Goldsmith)
Solution Manual Testing of Digital Systems (N. K. Jha & S. Gupta)
Solution Manual Space-Time Coding (Hamid Jafarkhani)
Solution Manual Space-Time Block Coding for Wireless Communications (Erik Larsson & Petre Stoica)
Solution Manual Smart Electronic Materials : Fundamentals and Applications (Jasprit Singh)
Solution Manual Radio-Frequency Electronics : Circuits and Applications (Jon Hagen)
Solution Manual Photonic Devices (Jia-ming Liu)
Solution Manual Networking Wireless Sensors (Bhaskar Krishnamachari)
Solution Manual Mobile Wireless Communications (Mischa Schwartz)

Solution Manual Introduction to Color Imaging Science (Hsien-Che Lee)
Solution Manual Fundamentals of Wireless Communication (David Tse & Pramod Viswanath)
Solution Manual Fundamentals of Modern VLSI Devices (Yuan Taur & Tak H. Ning)
Solution Manual Electronic and Optoelectronic Properties of Semiconductor Structures (Jasprit Singh)
Solution Manual An Introduction to Statistical Signal Processing (Robert M. Gray)
Solution Manual An Introduction to Radio Frequency Engineering (Christopher Coleman)
Solution Manual Algebraic Codes for Data Transmission (Richard Blahut)
Solution Manual Fundamentals of Solid State Electronics (C.T. Sah)
Solution Manual Fundamentals of Solid State Engineering (2nd Ed., Manijeh Razeghi)
Solution Manual Robot Modeling and Control (Spong, Hutchinson & Vidyasagar)
Solution Manual Theory of Applied Robotics : Kinematics, Dynamics and Control (Reza N. Jazar)
Solution Manual Control of Robot Manipulators in Joint Space (R. Kelly, V. Santibáñez, A. Loría)
Solution Manual Modelling and Control of Robot Manipulators (2nd Ed., Lorenzo Sciavicco, Bruno Siciliano)
Solution Manual Robotics : Modelling, Planning and Control (Bruno Siciliano, Lorenzo Sciavicco, Luigi Villani & Giuseppe Oriolo)
Solution Manual Fundamentals of Semiconductor Fabrication (Gary S. May, Simon M. Sze)
Solution Manual Semiconductor Devices : Physics and Technology (2nd Ed, Simon M. Sze)
Solution Manual Semiconductor Devices : Physics and Technology (3rd Ed, Simon M. Sze & Ming-Kwei Lee)
Solution Manual Electric Machinery (6th Ed., Fitzgerald)
Solution Manual Electric Machinery Fundamentals (4th Ed., Chapman)
Solution Manual Electric Machinery Fundamentals (5th Ed., Chapman)
Solution Manual Electric Machinery and Power System Fundamentals (Chapman)
Solution Manual Local Area Networks (2nd Ed., Keiser)
Solution Manual Signals and Systems : Analysis of Signals Through Linear Systems (1st Ed., M.J. Roberts)
Solution Manual Fundamentals of Signals and Systems (M.J. Roberts)
Solution Manual Introduction to Signals and Systems (Lindner)
Solution Manual Semiconductor Physics and Devices : Basic Principles (3rd Ed., Donald Neamen)
Solution Manual Semiconductor Physics and Devices : Basic Principles (4th Ed., Donald Neamen)
Solution Manual An Introduction to Semiconductor Devices (Donald Neamen)
Solution Manual Microelectronic Circuit Analysis and Design (3rd Ed., Donald Neamen)
Solution Manual Microelectronic Circuit Analysis and Design (4th Ed., Donald Neamen)
Solution Manual Electronic Circuit Analysis and Design (2nd Ed., Donald Neamen)
Solution Manual Design for Electrical and Computer Engineers (1st Ed., Ralph Ford & Chris Coulston)
Solution Manual Fundamentals of Modeling and Analyzing Engineering Systems (Cha, Rosenberg, Dym)
Solution Manual Linear Systems (Panos J. Antsaklis & Anthony N. Michel)
Solution Manual A Linear Systems Primer (Panos J. Antsaklis & Anthony N. Michel)
Solution Manual Principles of Linear Systems (Philip E. Sarachik)
Solution Manual Linear Systems Control : Deterministic and Stochastic Methods (Elbert Hendricks, Ole Jannerup & Paul Haase Sørensen)
Solution Manual Power Systems Harmonics : Fundamentals, Analysis and Filter Design (George

J. Wakileh)
Solution Manual Principles of Adaptive Filters and Self-learning Systems (Anthony Zaknich)
Solution Manual Algebraic Methods for Nonlinear Control Systems (2nd Ed., Conte, Moog & Perdon)
Solution Manual Discrete-Time Control Systems (2nd Ed., K. Ogata)
Solution Manual Modern Control Engineering - Problems B (3rd Ed., K. Ogata)
Solution Manual Modern Control Engineering (4th Ed., K. Ogata)
Solution Manual Modern Control Engineering (5th Ed., K. Ogata)
Solution Manual Modern Control Engineering - International Version (5th Ed., K. Ogata)
Solution Manual LabVIEW 8 Student Edition (Bishop)
Solution Manual LabVIEW 2009 Student Edition (Bishop)
Solution Manual Learning with LabVIEW 2009 (Bishop)
Solution Manual Introduction to Feedback Control (Li Qiu & Kemin Zhou)
Solution Manual Modeling and Simulation of Dynamic Systems (Robert Woods, Jr. & Kent Lawrence)
Solution Manual Feedback Control Systems (4th Ed., Charles L. Phillips, Royce D. Harbor)
Solution Manual Feedback Control Systems (5th Ed., Charles L. Phillips, John Parr)
Solution Manual Feedback Control of Dynamic Systems (4th Ed., Gene Franklin, J.D. Powell, Abbas Emami-Naeini)
Solution Manual Feedback Control of Dynamic Systems (5th Ed., Gene Franklin, J.D. Powell, Abbas Emami-Naeini)
Solution Manual Feedback Control of Dynamic Systems (6th Ed., Gene Franklin, J.D. Powell, Abbas Emami-Naeini)
Solution Manual Feedback Control of Dynamic Systems - International Version (6th Ed., Gene Franklin, J.D. Powell, Abbas Emami-Naeini)
Solution Manual Predictive Control with Constraints (Jan Maciejowski)
Solution Manual Computer Numerical Control : Operation and Programming (3rd Ed., Stenerson & Curran)
Solution Manual Engineering Problem Solving with C (3rd Ed., Etter)
Solution Manual Engineering Problem Solving with C++ (2nd Ed., Etter)
Solution Manual Process Control Instrumentation Technology (8th Ed., Johnson)
Solution Manual Electrical Power and Controls (2nd Ed., Skvarenina & DeWitt)
Solution Manual Electronics and Computer Math (8th Ed., Deem & Zannini)
Solution Manual Circuits, Signals, and Systems for Bioengineers : A MATLAB-Based Introduction (John Semmlow)
Solution Manual Signals and Systems for Bioengineers : A MATLAB-Based Introduction (2nd Ed., John Semmlow)
Solution Manual VLSI Test Principles and Architectures : Design for Testability (Laung-Terng Wang, Cheng-Wen Wu & Xiaoqing Wen)
Solution Manual Mechatronics : Principles and Applications (Godfrey Onwubolu)
Solution Manual Mechatronics (Sabri Cetinkunt)
Solution Manual Introduction to Mechatronic Design (J. Edward Carryer, Matthew Ohline & Thomas Kenny)
Solution Manual Introduction to Mechatronics and Measurement Systems (2nd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (3rd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (4th Ed., David Alciatore & Michael Histand)
Solution Manual Machine Vision : Theory, Algorithms, Practicalities (3rd Ed., E. R. Davies)
Solution Manual Essential Java for Scientists and Engineers (Brian D. Hahn & Katherine M.

Malan)
Solution Manual Guide to Microsoft Excel 2002 for Scientists and Engineers (3rd Ed., Bernard V. Liengme)
Solution Manual 10-Key Touch Key : Developing Speed and Accuracy (Burton)
Solution Manual Introduction to C++ Programming, Brief Version (Y. Daniel Liang)
Solution Manual Introduction to C++ Programming, Comprehensive (Y. Daniel Liang)
Solution Manual C++ for Business Programmers (2nd Ed., John C. Molluzzo)
Solution Manual Introduction to Java Programming - Brief Version (7th Ed., Liang)
Solution Manual Introduction to Java Programming - Brief Version (8th Ed., Liang)
Solution Manual Introduction to Java Programming - Brief Version - International Edition (8th Ed., Liang)
Solution Manual Introduction to Java Programming - Comprehensive Version (6th Ed., Liang)
Solution Manual Introduction to Java Programming - Comprehensive Version (7th Ed., Liang)
Solution Manual Introduction to Java Programming - Comprehensive Version (8th Ed., Liang)
Solution Manual Introduction to Java Programming - Comprehensive Version - International Edition (8th Ed., Liang)
Solution Manual Introduction to Java Programming : Fundamentals First (6th Ed., Y. Daniel Liang)
Solution Manual Objects First With Java : A Practical Introduction Using BlueJ (3rd Ed., Barnes & Kolling)
Solution Manual Simply Java Programming : An Application-Driven™ Tutorial Approach (Deitel)
Solution Manual ADTs, Data Structures, and Problem Solving with C++ (2nd Ed., Larry R. Nyhoff)
Solution Manual Java : An Introduction to Computing (Joel Adams, Larry R. Nyhoff & Jeffrey Nyhoff)
Solution Manual Advanced Java™ 2 Platform How to Program (Deitel & Santry)
Solution Manual SQL for SQL Server (Bijoy Bordoloi & Douglas B. Bock)
Solution Manual SQL Clearly Explained (3rd Ed., Jan Harrington)
Solution Manual An Introduction to Programming Using Visual Basic 2005 (6th Ed., Schneider)
Solution Manual An Introduction to Programming Using Visual Basic 2008 (7th Ed., Schneider)
Solution Manual An Introduction to Programming Using Visual Basic 2010 (8th Ed., Schneider)
Solution Manual Simply Visual Basic .NET (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto)
Solution Manual Simply Visual Basic 2005 (2nd Ed., Harvey & Paul Deitel)
Solution Manual Simply Visual Basic 2008 (3rd Ed., Harvey & Paul Deitel)
Solution Manual Visual Basic 2005 How to Program (3rd Ed., Deitel)
Solution Manual Visual Basic 2008 How to Program (4th Ed., Deitel)
Solution Manual Visual Basic 2010 How to Program (5th Ed., Deitel)
Solution Manual An Introduction to Programming with Visual Basic 6.0 (4th Ed., Schneider)
Solution Manual Visual Basic.Net Programming (2nd Ed., Jeffrey Tsay)
Solution Manual Simply Visual Basic .NET (Harvey & Paul Deitel & Nieto)
Solution Manual Mechatronics (Sabri Cetinkunt)
Solution Manual PC Systems, Installation and Maintenance (2nd Ed., R.P. Beales)
Solution Manual Introduction to Linear Programming (Leonid N. Vaserstein)
Solution Manual Electric Circuits Fundamentals (8th Ed., Thomas Floyd)
Solution Manual Introductory Circuit Analysis (11th Ed., Robert L. Boylestad)
Solution Manual Introductory Circuit Analysis (12th Ed., Robert L. Boylestad)
Solution Manual Principles of Electric Circuits : Conventional Current Version (8th Ed., Thomas Floyd)
Solution Manual Principles of Electric Circuits : Conventional Current Version (9th Ed., Thomas Floyd)

Solution Manual Principles of Electric Circuits : Electron Flow Version (8th Ed., Thomas L. Floyd)
Solution Manual Principles of Electric Circuits : Electron Flow Version (9th Ed., Thomas L. Floyd)
Solution Manual Contemporary Electric Circuits : Insights and Analysis (2nd ed., Strangeway, Petersen, Gassert & Lokken)
Solution Manual Introductory Electronic Devices and Circuits : Electron Flow Version (7th Ed., Paynter)
Solution Manual Introductory Electronic Devices and Circuits : Conventional Flow Version (7th Ed., Paynter)
Solution Manual Electronics Technology Fundamentals : Conventional Flow (2nd Ed., Robert T. Paynter & Toby Boydell)
Solution Manual Electronics Technology Fundamentals : Conventional Flow (3rd Ed., Robert T. Paynter & Toby Boydell)
Solution Manual Electronics Technology Fundamentals : Electron Flow (2nd Ed., Robert T. Paynter, Toby Boydell)
Solution Manual Electronics Technology Fundamentals : Electron Flow (3rd Ed., Robert T. Paynter, Toby Boydell)
Solution Manual Introductory DC/AC Circuits (6th Ed., Nigel P. Cook)
Solution Manual Introductory DC/AC Electronics (6th Ed., Nigel P. Cook)
Solution Manual Electronic Devices : Conventional Current Version (7th Ed., Floyd)
Solution Manual Electronic Devices : Conventional Current Version (8th Ed., Floyd)
Solution Manual Electronic Devices : Electron Flow Version (7th, Floyd)
Solution Manual Electronic Devices : Electron Flow Version (8th, Floyd)
Solution Manual Electronics Fundamentals : Circuits, Devices and Applications (7th Ed., Thomas L. Floyd)
Solution Manual Electronics Fundamentals : Circuits, Devices and Applications (8th Ed., Floyd & Buchla)
Solution Manual Electronic Devices and Circuit Theory (9th Ed., Boylestad, Nashelsky)
Solution Manual Electronic Devices and Circuit Theory (10th Ed., Boylestad, Nashelsky)
Solution Manual The Science of Electronics : DC/AC (David M. Buchla, Thomas L. Floyd)
Solution Manual The Science of Electronics : Digital (Floyd & Buchla)
Solution Manual The Science of Electronics: Analog Devices (Floyd & Buchla)
Solution Manual Digital Electronics : A Practical Approach (7th Ed., Kleitz)
Solution Manual Digital Electronics : A Practical Approach (8th Ed., Kleitz)
Solution Manual Digital Systems : Principles and Applications (10th Ed., Tocci, Widmer & Moss)
Solution Manual Digital Systems : Principles and Applications (11th Ed., Tocci, Widmer & Moss)
Solution Manual Digital Electronics with VHDL - Quartus II Version (Kleitz)
Solution Manual Digital Fundamentals (9th Ed., Floyd)
Solution Manual Digital Fundamentals (10th Ed., Floyd)
Solution Manual Digital Fundamentals with PLD Programming (Thomas L. Floyd)
Solution Manual The 8051 Microcontroller (4th Ed., MacKenzie & Chung-Wei Phan)
Solution Manual The 8051 Microcontroller and Embedded Systems (2nd Ed., Muhammad Ali Mazidi, Janice Mazidi & Rolin McKinlay)
Solution Manual INTEL Microprocessors 8086/8088, 80186/80188, 80286, 80386, 80486, Pentium, Prentium ProProcessor, Pentium II, III, 4, (7th Ed., Barry B. Brey)
Solution Manual Microcontroller Technology : The 68HC11 (5th Ed., Peter Spasov)
Solution Manual PIC Microcontroller (Muhammad Ali Mazidi, Rolin McKinlay & Danny Causey)

Solution Manual HCS12 Microcontrollers and Embedded Systems : Using Assembly and C with CodeWarrior (Muhammad Ali Mazidi, Danny Causey & Janice Mazidi)
Solution Manual The x86 PC : Assembly Language, Design, and Interfacing (5th Ed., Muhammad Ali Mazidi, Janice Mazidi & Danny Causey)
Solution Manual The AVR Microcontroller and Embedded Systems : Using Assembly and C (Muhammad Ali Mazidi, Sarmad Naimi & and Sepehr Naimi)
Solution Manual Industrial Electronics (James A. Rehg, Glenn J. Sartori)
Solution Manual Programmable Controllers Using the Allen-Bradley SlC-500 Family (2nd Ed., Dave Geller)
Solution Manual Programmable Logic Controllers (James A. Rehg, Glenn J. Sartori)
Solution Manual Fundamentals of Programmable Logic Controllers, Sensors, and Communications (3rd Ed., Jon Stenerson)
Solution Manual An Introduction to Programming with Visual Basic 6.0, Update Edition (4th Ed., Schneider)
Solution Manual C++ Programming Today (1st Ed., Barbara Johnston)
Solution Manual C++ Programming Today (2nd Ed., Barbara Johnston)
Solution Manual Introduction to Data Communications and Networking (Wayne Tomasi)
Solution Manual Introduction to Telecommunications (2nd Ed., Martha Rosengrant)
Solution Manual Network Security Essentials : Applications and Standards (3rd Ed., William Stallings)
Solution Manual Network Security Essentials : Applications and Standards (4th Ed., William Stallings)
Solution Manual Information Security: Principles and Practices (Mark Merkow, James Breithaupt)
Solution Manual Principles and Practice of Information Security (Linda Volonino, Stephen R. Robinson)
Solution Manual Principles of Electronic Communication Systems (3rd Ed., Louis E. Frenzel)
Solution Manual Modern Electronic Communication (8th Ed., Jeff Beasley, Gary M. Miller)
Solution Manual Modern Electronic Communication (9th Ed., Jeff Beasley, Gary M. Miller)
Solution Manual Electronic Communications for Technicians (2nd ed., Tom Wheeler)
Solution Manual Concepts In Systems and Signals (2nd Ed., John D. Sherrick)
Solution Manual Understanding Fiber Optics (5th Ed., Jeff Hecht)
Solution Manual Understanding UNIX/LINUX Programming : A Guide to Theory and Practice (Bruce Molay)
Solution Manual Applying PIC18 Microcontrollers : Architecture, Programming, and Interfacing using C and Assembly (Barry Brey)
Solution Manual Electrical Power and Controls (2nd Ed., Timothy L. Skvarenina, William E. DeWitt)
Solution Manual Process Control Instrumentation Technology (8th Ed., Curtis Johnson)
Solution Manual Electrical Machines, Drives and Power Systems (6th Ed., Theodore Wildi)
Solution Manual Introduction to Vacuum Technology (David M. Hata)
Solution Manual Electronic Project Design and Fabrication (6th Ed., Ronald A. Reis)
Solution Manual Technology and Society (3rd Ed., Linda Hjorth, Barbara A. Eichler, Ahmed S. Khan, John Morello)
Solution Manual Solid State Electronic Devices (6th Ed., Ben Streetman, Sanjay Banerjee)
Solution Manual Approaching Quantum Computing (Dan C. Marinescu & Gabriela M. Marinescu)
Solution Manual Foundations of MEMS (Chang Liu)
Solution Manual Foundations of MEMS (2nd Ed., Chang Liu)
Solution Manual Basic Electromagnetics with Applications (Nannapaneni Narayana Rao)
Solution Manual Elements of Engineering Electromagnetics (6th Ed., Nannapaneni Narayana

Rao)
Solution Manual Fundamentals of Electromagnetics for Electrical and Computer Engineering (Nannapaneni Narayana Rao)
Solution Manual Principles of Digital Design (Daniel D. Gajski)
Solution Manual Digital Design (4th Ed., M. Morris Mano & Michael D. Ciletti)
Solution Manual Digital Design (5th Ed., M. Morris Mano & Michael D. Ciletti)
Solution Manual Digital Design : Principles and Practices Package (4th Ed., John F. Wakerly)
Solution Manual VHDL: A Starter's Guide (2nd Ed., Sudhakar Yalamanchili)
Solution Manual Computer Organization and Architecture : Designing for Performance (7th Ed., William Stallings)
Solution Manual Computer Organization and Architecture : Designing for Performance (8th Ed., William Stallings)
Solution Manual Parallel Programming : Techniques and Applications Using Networked Workstations and Parallel Computers (2nd Ed., Barry Wilkinson & Michael Allen)
Solution Manual Fundamentals of Parallel Processing (Harry F. Jordan & Gita Alaghband)
Solution Manual Digital and Analog Communication Systems (7th Ed., Leon W. Couch)
Solution Manual Digital and Analog Communication Systems (8th Ed., Leon W. Couch)
Solution Manual Digital Communications (4th Ed., John Proakis)
Solution Manual Digital Communications (5th Ed., John Proakis)
Solution Manual Fundamentals of Communication Systems (John G. Proakis & Masoud Salehi)
Solution Manual Communication Systems Engineering (2nd Ed., John G. Proakis & Masoud Salehi)
Solution Manual Principles of Digital Communication and Coding (Andrew J. Viterbi, Jim K. Omura)
Solution Manual Modern Wireless Communications (Simon Haykin, Michael Moher)
Solution Manual ISDN and Broadband ISDN with Frame Relay and ATM (4th Ed., William Stallings)
Solution Manual Data and Computer Communications (8th Ed., William Stallings)
Solution Manual Cryptography and Network Security (4th Ed., William Stallings)
Solution Manual Cryptography and Network Security : Principles and Practice (5th Ed., William Stallings)
Solution Manual Computer Networking with Internet Protocols (William Stallings)
Solution Manual Local and Metropolitan Area Networks (6th Ed., William Stallings)
Solution Manual Probabilistic Systems and Random Signals (Abraham Haddad)
Solution Manual Error Control Coding (2nd Ed., Shu Lin & Daniel J. Costello)
Solution Manual Wireless Communications & Networks (2nd ed., William Stallings)
Solution Manual Wireless Communications and Networking (Jon W. Mark, Weihua Zhuang)
Solution Manual Detection and Estimation Theory (Thomas Schonhoff & Arthur Giordano)
Solution Manual Digital Control System Analysis and Design (3rd Ed., Charles L. Phillips, H. Troy Nagle)
Solution Manual Signals, Systems, and Transforms (3rd Ed., Charles Phillips, John Parr & Eve Riskin)
Solution Manual Signals, Systems, and Transforms (4th Ed., Charles Phillips, John Parr & Eve Riskin)
Solution Manual Signals, Systems, and Transforms - International Version (4th Ed., Charles Phillips, John Parr & Eve Riskin)
Solution Manual Fundamentals of Signals and Systems Using the Web and Matlab (3rd Ed., Edward Kamen & Bonnie Heck)
Solution Manual Adaptive Filter Theory (4th Ed., Simon Haykin)
Solution Manual Neural Networks and Learning Machines (3rd Ed., Simon Haykin)

Solution Manual Spectral Analysis of Signals (Petre Stoica & Randolph L. Moses)
Solution Manual Fluency with Information Technology : Skills, Concepts, and Capabilities (2nd Ed., Snyder)
Solution Manual Fluency with Information Technology : Skills, Concepts, and Capabilities (3rd Ed., Snyder)
Solution Manual Fluency with Information Technology, Brief Edition (Lawrence Snyder)
Solution Manual Excel 2003 Volume II: Advanced Concepts in Excel (5th Ed., Karen Jolly)
Solution Manual Focus on Excel 2003 (Julie Hayward Spooner)
Solution Manual Comprehensive Excel 2002 for Office XP (4th Ed., Karen Jolly)
Solution Manual Ethics for the Information Age (2nd Ed., Michael Quinn)
Solution Manual Ethics for the Information Age (3rd Ed., Michael Quinn)
Solution Manual Computer Science : An Overview (8th Ed., J. Glenn Brookshear)
Solution Manual Computer Science : An Overview (9th Ed., J. Glenn Brookshear)
Solution Manual Computer Science : An Overview (10th Ed., J. Glenn Brookshear)
Solution Manual Excel 2003 Volume 1 : Core Concepts in Excel (5th Ed., Karen J. Jolly)
Solution Manual Concise Prelude to Programming : Concepts and Design (2nd Ed., Stewart Venit)
Solution Manual Concise Prelude to Programming (3rd Ed., Stewart Venit & Elizabeth Drake)
Solution Manual Extended Prelude to Programming : Concepts and Design (2nd Ed., Stewart Venit)
Solution Manual Extended Prelude to Programming (3rd Ed., Stewart Venit & Elizabeth Drake)
Solution Manual Logic and Design of Computer Programs (Jim Messinger)
Solution Manual Absolute C++ (2nd Ed., Walter Savitch)
Solution Manual Absolute C++ (3rd Ed., Walter Savitch)
Solution Manual Absolute C++ (4th Ed., Walter Savitch)
Solution Manual Problem Solving with C++ : The Object of Programming (5th Ed., Walter Savitch)
Solution Manual Problem Solving with C++ (6th Ed., Walter Savitch)
Solution Manual Problem Solving with C++ (7th Ed., Walter Savitch)
Solution Manual Problem Solving with C++ (8th Ed., Walter Savitch)
Solution Manual Problem Solving, Abstraction, and Design using C++ (4th Ed., Frank Friedman & Elliot Koffman)
Solution Manual Problem Solving, Abstraction & Design Using C++ (5th Ed., Frank Friedman & Elliot Koffman)
Solution Manual Starting Out with C++ : From Control Structures through Objects (5th Ed., Tony Gaddis)
Solution Manual Starting Out with C++ : From Control Structures through Objects (6th Ed., Tony Gaddis)
Solution Manual Starting Out with C++ : From Control Structures through Objects (7th Ed., Tony Gaddis)
Solution Manual Starting Out with C++ : From Control Structures through Objects - Brief Version (6th Ed., Tony Gaddis)
Solution Manual Starting Out with C++ : From Control Structures through Objects - Brief Version (7th Ed., Tony Gaddis)
Solution Manual Starting out with C++ Brief Version Updated (4th Ed., Gaddis & Krupnow)
Solution Manual Starting out with C++ Brief Version (5th Ed., Gaddis & Krupnow)
Solution Manual Starting Out with C++ : Brief Version Update, Visual C++ .NET (4th Ed., Gaddis & Krupnow)
Solution Manual Starting Out with C++ : Early Objects (5th Ed., Gaddis, Walters & Muganda)
Solution Manual Starting Out with C++ : Early Objects (6th Ed., Gaddis, Walters & Muganda)

Solution Manual Starting Out with C++ : Early Objects (7th Ed., Gaddis, Walters & Muganda)
Solution Manual C++ By Dissection (Ira Pohl)
Solution Manual Essential C++ for Engineers and Scientists (2nd Ed., Jeri Hanly)
Solution Manual C++ Coach : Essentials for Introductory Programming (Jeff Salvage)
Solution Manual C++ Primer (4th Ed., Stanley Lippman, Josée Lajoie & Barbara Moo)
Solution Manual Engineering Computation with MATLAB (1st Ed., David Smith)
Solution Manual Engineering Computation with MATLAB (2nd Ed., David Smith)
Solution Manual Absolute Java (1st Ed., Walter Savitch)
Solution Manual Absolute Java (2nd Ed., Walter Savitch)
Solution Manual Absolute Java (3rd Ed., Walter Savitch)
Solution Manual Absolute Java (4th Ed., Walter Savitch)
Solution Manual The Art and Science of Java (Eric Roberts)
Solution Manual Building Java Programs : A Back to Basics Approach (Stuart Reges & Martin Stepp)
Solution Manual Introduction to Programming in Java : An Interdisciplinary Approach (Robert Sedgewick & Kevin Wayne)
Solution Manual Java Foundations: Introduction to Program Design and Data Structures (John Lewis, Peter DePasquale & Joe Chase)
Solution Manual Starting Out with Java : Early Objects (3rd Ed., Gaddis)
Solution Manual Starting Out with Java : From Control Structures through Objects (3rd Ed., Gaddis)
Solution Manual Starting Out with Java : From Control Structures through Objects (4th Ed., Gaddis)
Solution Manual Java Software Solutions (Java 5.0 version) : Foundations of Program Design (4th Ed., Lewis & Loftus)
Solution Manual Java Software Solutions : Foundations of Program Design (5th Ed., Lewis & Loftus)
Solution Manual Java Software Solutions : Foundations of Program Design (6th Ed., Lewis & Loftus)
Solution Manual Starting Out with Java : From Control Structures through Data Structures (Gaddis & Muganda)
Solution Manual Object of Java, The: Introduction to Programming Using Software Engineering Principles (2nd Ed, David Riley)
Solution Manual Object-Oriented Programming in Java : A Graphical Approach, Preliminary Edition (Kathryn E. Sanders & Andy van Dam)
Solution Manual Starting Out with Java 5 : Control Structures to Objects (Tony Gaddis)
Solution Manual Starting Out with Java 5 : Early Objects (Tony Gaddis)
Solution Manual Introduction to Programming Using Java : An Object-Oriented Approach (2nd Ed., David Arnow, Scott Dexter & Gerald Weiss)
Solution Manual Computing with Java (2nd Ed., Art Gittleman)
Solution Manual Problem Solving with Java, Update (2nd Ed., Elliot B. Koffman & Ursula Wolz)
Solution Manual Starting Out with Alice : A Visual Introduction to Programming (Tony Gaddis)
Solution Manual Problem Solving and Program Design in C (4th Ed., Jeri Hanly & Elliot Koffman)
Solution Manual Problem Solving and Program Design in C (5th Ed., Jeri Hanly & Elliot Koffman)
Solution Manual Problem Solving and Program Design in C (6th Ed., Jeri Hanly & Elliot Koffman)

Solution Manual Starting Out with Visual Basic 2005 (3rd Ed., Tony Gaddis & Kip Irvine)
Solution Manual Starting Out with Visual Basic 6 (Tony Gaddis, Kip Irvine & Bruce Denton)
Solution Manual Starting Out with Visual Basic.Net (2nd Ed., Tony Gaddis, Kip Irvine & Bruce Denton)
Solution Manual Computer Programming Fundamentals with Applications in Visual Basic® 6.0 (Mitchell Kerman & Ronald Brown)
Solution Manual Advanced VB.NET Alternate with VB.Net CD's (3rd Ed., Kip Irvine & Tony Gaddis)
Solution Manual Advanced Visual Basic 2005 (4th Ed., Kip Irvine & Tony Gaddis)
Solution Manual C# Software Solutions : Foundations of Program Design (John Lewis)
Solution Manual Problem Solving, Abstraction and Design Using C++, Visual C++.NET Edition (Frank Friedman & Elliot Koffman)
Solution Manual Ada 95 : Problem Solving and Program Design (3rd Ed., Michael Feldman & Elliot Koffman)
Solution Manual Programming and Problem Solving with Delphi (Mitchell Kerman)
Solution Manual C Program Design for Engineers (2nd Ed., Jeri Hanly & Elliot Koffman)
Solution Manual Data Abstraction & Problem Solving with C++ (5th ed., Frank Carrano)
Solution Manual Data Structures and Algorithm Analysis in C++ (2nd Ed., Mark Allen Weiss)
Solution Manual Data Structures and Algorithm Analysis in C++ (3rd Ed., Mark Allen Weiss)
Solution Manual Data Abstraction and Problem Solving with C++ : Walls and Mirrors (4th Ed., Frank Carrano)
Solution Manual Data Structures and Problem Solving Using C++ (2nd Ed., Mark Allen Weiss)
Solution Manual Data Structures and Algorithm Analysis in Java (2nd Ed., Mark Allen Weiss)
Solution Manual Data Structures in Java : From Abstract Data Types to the Java Collections Framework (Simon Gray)
Solution Manual Data Abstraction and Problem Solving with Java (2nd Ed., Frank Carrano & Janet Prichard)
Solution Manual Data Structures and Other Objects Using Java (3rd Ed., Michael Main)
Solution Manual Data Structures and Problem Solving Using Java (3rd Ed., Mark Allen Weiss)
Solution Manual Data Structures and Problem Solving Using Java (4th Ed., Mark Allen Weiss)
Solution Manual Java Software Structures : Designing and Using Data Structures (2nd Ed., John Lewis, Joseph Chase)
Solution Manual The Object of Data Abstraction and Structures (using Java) (David Riley)
Solution Manual Classic Data Structures in Java (Timothy Budd)
Solution Manual Data Structures in Java (Thomas A. Standish)
Solution Manual Data Structures, Algorithms and Software Principles in C (Thomas A. Standish)
Solution Manual Introduction to the Design and Analysis of Algorithms (1st Ed., Anany Levitin)
Solution Manual Introduction to the Design and Analysis of Algorithms (2nd Ed., Anany Levitin)
Solution Manual Algorithm Design (Jon Kleinberg & Éva Tardos)
Solution Manual Data Structures and Algorithm Analysis in C (2nd Ed., Mark Allen Weiss)
Solution Manual Computer Algorithms : Introduction to Design and Analysis (3rd Ed., Sara Baase & Allen Van Gelder)
Solution Manual Artificial Intelligence : Structures and Strategies for Complex Problem Solving (6th Ed., George Luger)
Solution Manual Artificial Intelligence : A Modern Approach (2nd Ed., Stuart Russell & Peter Norvig)
Solution Manual The Complete A+ Guide to PC Repair (3rd Ed., Cheryl Schmidt)

Solution Manual The Complete A+ Guide to PC Repair (4th Ed., Cheryl Schmidt)
Solution Manual Complete Computer Repair Textbook (4th Ed., Cheryl Schmidt)
Solution Manual Computer Systems Organization and Architecture (John D. Carpinelli)
Solution Manual CMOS VLSI Design : A Circuits and Systems Perspective (3rd Ed., Neil Weste & David Harris)
Solution Manual CMOS VLSI Design : A Circuits and Systems Perspective (4th Ed., Neil Weste & David Harris)
Solution Manual Interactive Computer Graphics : A Top-Down Approach Using OpenGL (4th Ed., Edward Angel)
Solution Manual Interactive Computer Graphics : A Top-Down Approach Using OpenGL (5th Ed., Edward Angel)
Solution Manual File Structures : An Object-Oriented Approach with C++ (3rd Ed., Michael J. Folk, Bill Zoellick & Greg Riccardi)
Solution Manual Oracle 10g Programming : A Primer (Rajshekhar Sunderraman)
Solution Manual Databases, Types and the Relational Model (3rd Ed., C. J. Date & Hugh Darwen)
Solution Manual Fundamentals of Database Systems (5th Ed., Ramez Elmasri & Shamkant Navathe)
Solution Manual Database Systems : An Application-Oriented Approach, Introductory Version (2nd Ed., Michael Kifer, Arthur Bernstein & Philip M. Lewis)
Solution Manual Database Systems : An Application Oriented Approach, Complete Version (2nd Ed., Michael Kifer, Arthur Bernstein & Philip M. Lewis)
Solution Manual DataBase Systems : A Practical Approach to Design, Implementation and Management (4th Ed., Thomas M. Connolly & Carolyn E. Begg)
Solution Manual DataBase Systems : A Practical Approach to Design, Implementation and Management (5th Ed., Thomas M. Connolly & Carolyn E. Begg)
Solution Manual Database Systems : The Complete Book (2nd Ed., Hector Garcia-Molina, Jeffrey D. Ullman, Jennifer Widom)
Solution Manual A First Course in Database Systems (3rd Ed., Jeffrey D. Ullman, Jennifer Widom)
Solution Manual Fundamentals of Database Systems/Oracle 9i Programming (4th Ed., Ramez Elmasri, Shamkant B. Navathe & Rajshekhar Sunderraman)
Solution Manual An Introduction to Database Systems (8th Ed., C.J. Date)
Solution Manual Oracle 9i Programming : A Primer (Rajshekhar Sunderraman)
Solution Manual Elements of Information Theory (1st Ed., Thomas M. Cover & Joy A. Thomas)
Solution Manual Principles of Database Systems with Internet and Java Applications (Greg Riccardi)
Solution Manual Introduction to Data Mining (Pang-Ning Tan, Michael Steinbach & Vipin Kumar)
Solution Manual Data Mining: A Tutorial Based Primer (Richard Roiger & Michael Geatz)
Solution Manual Learning SQL : A Step-by-Step Guide Using Access (Sikha Bagui, Richard Earp)
Solution Manual Learning SQL : A Step-By-Step Guide Using Oracle (Richard Earp, Sikha Bagui)
Solution Manual Access 2007 Guidebook (6th Ed., Maggie Trigg & Phyllis Dobson)
Solution Manual Access 2003 Guidebook for Office XP (5th Ed., Maggie Trigg & Phyllis Dobson)
Solution Manual Implementing Databases in Oracle 9i (John Day & Craig Van Slyke)
Solution Manual Web 101: Making the Net Work for You (2nd Ed., Wendy Lehnert)
Solution Manual Web 101 (3rd Ed., Wendy G. Lehnert & Richard L. Kopec)

Solution Manual Web Developer Foundations : Using XHTML (2nd Ed., Terry Felke-Morris)
Solution Manual Web Development & Design Foundations With XHTML (3rd Ed., Terry Felke-Morris)
Solution Manual Web Development and Design Foundations with XHTML (4th Ed., Terry Felke-Morris)
Solution Manual Internet Effectively : A Beginner's Guide to the World Wide Web (Tyrone Adams & Sharon Scollard)
Solution Manual Light on the Web : Essentials to Making the 'Net Work for You (Wendy G. Lehnert)
Solution Manual Programming the World Wide Web (3rd Ed., Robert W. Sebesta)
Solution Manual Programming the World Wide Web (4th Ed., Robert W. Sebesta)
Solution Manual Programming the World Wide Web (5th Ed., Robert W. Sebesta)
Solution Manual Programming the World Wide Web (6th Ed., Robert W. Sebesta)
Solution Manual XML: Language Mechanics and Applications (Dwight Peltzer)
Solution Manual Practical Perl with CGI Applications (Elizabeth Chang)
Solution Manual Developing Web Applications with Active Server Pages (Thom Luce)
Solution Manual Structure and Interpretation of Signals and Systems (Edward A. Lee & Pravin Varaiya)
Solution Manual Languages and Machines : An Introduction to the Theory of Computer Science (2nd Ed., Thomas Sudkamp)
Solution Manual Languages and Machines : An Introduction to the Theory of Computer Science (3rd Ed., Thomas Sudkamp)
Solution Manual How to Break Software Security (James A. Whittaker & Herbert H. Thompson)
Solution Manual Software Quality Assurance : From Theory to Implementation (Daniel Galin)
Solution Manual Object Oriented Software Development Using Java (2nd Ed., Xiaoping Jia)
Solution Manual Introduction to the Team Software Process (Watts S. Humphrey)
Solution Manual Software Project Management : A Real-World Guide to Success (Joel Henry)
Solution Manual Software Engineering (7th Ed., Ian Sommerville)
Solution Manual Software Engineering (8th Ed., Ian Sommerville)
Solution Manual Software Engineering (9th Ed., Ian Sommerville)
Solution Manual Software Engineering (3rd Ed., Shari Lawrence Pfleeger & Joanne Atlee)
Solution Manual Software Engineering : Theory and Practice (4th Ed., Shari Lawrence Pfleeger & Joanne Atlee)
Solution Manual Object-Oriented Programming featuring Graphical Applications in Java (Michael Laszlo)
Solution Manual Project-Based Software Engineering : An Object-Oriented Approach (Evelyn Stiller & Cathie LeBlanc)
Solution Manual Engineering of Software, The: A Technical Guide for the Individual (Dick Hamlet & Joe Maybee)
Solution Manual Concepts of Programming Languages (7th Ed., Robert W. Sebesta)
Solution Manual Concepts of Programming Languages (8th Ed., Robert W. Sebesta)
Solution Manual Concepts of Programming Languages (9th Ed., Robert W. Sebesta)
Solution Manual Advanced Java : Internet Applications (2nd Ed., Art Gittleman)
Solution Manual Objects to Components with Java 2 Platform (Art Gittleman)
Solution Manual C for Java Programmers (Tomasz Muldner)
Solution Manual Pointers on C (Kenneth Reek)
Solution Manual C++ Programming with Design Patterns Revealed (Tomasz Muldner)
Solution Manual The C++ Programming Language (3rd Ed., Bjarne Stroustrup)
Solution Manual Operating Systems : A Systematic View (6th Ed., William S. Davis & T.M. Rajkumar)

Solution Manual Unix: The Textbook (2nd Ed., Syed Mansoor Sarwar, Robert Koretsky & Syed Aqeel Sarwar)
Solution Manual Operating Systems (3rd Ed., Gary Nutt)
Solution Manual LINUX & UNIX Programming Tools : A Primer for Software Developers (Syed Mansoor Sarwar & Khaled H. Al-Saqabi)
Solution Manual Addison-Wesley's Interactive Linux Tutorial and Reference (Edutrends, Inc.)
Solution Manual Linux : The Textbook (Syed Mansoor Sarwar, Robert Koretsky & Syed Aqeel Sarwar)
Solution Manual Kernel Projects for Linux (Gary Nutt)
Solution Manual OSP : An Environment for Operating System Projects (Michael Kifer & Scott A. Smolka)
Solution Manual Distributed Computing : Principles and Applications (M.L. Liu)
Solution Manual Distributed Operating Systems and Algorithm Analysis (Randy Chow & Theodore Johnson)
Solution Manual Mastering Networks : An Internet Lab Manual (Jorg Liebeherr & Magda El Zarki)
Solution Manual Computer Networking Complete Package (3rd Ed., James Kurose & Keith Ross)
Solution Manual Computer Networking : A Top-Down Approach Featuring the Internet (3rd Ed., James Kurose & Keith Ross)
Solution Manual Computer Networking : A Top-Down Approach (4th Ed., James Kurose & Keith Ross)
Solution Manual Computer Networking : A Top-Down Approach (5th Ed., James Kurose & Keith Ross)
Solution Manual Producing Great Sound for Film and Video (3rd Ed., Jay Rose)
Solution Manual Network Management : Principles and Practice (Mani Subramanian)
Solution Manual Computer Security : Art and Science (Matt Bishop)
Solution Manual Introduction to Computer Security (Matt Bishop)
Solution Manual Creating Powerful Brands (4th Ed., Leslie de Chernatony, Malcolm McDonald, Elaine Wallace)
Solution Manual How to Break Software Security (James A. Whittaker & Herbert H. Thompson)
Solution Manual Parallel Programming in C with MPI and Open MP (Michael Quinn)
Solution Manual Modern Recording Techniques (6th Ed., Miles Huber & Runstein)
Solution Manual Creating Powerful Radio : Getting, Keeping and Growing Audiences News, Talk, Information & Personality Broadcast, HD, Satellite & Internet (Valerie Geller)
Solution Manual Electronic Media Law and Regulation (5th Ed., Kenneth Creech)
Solution Manual Electronic Media Management, Revised (5th Ed., Pringle & Starr)
Solution Manual Convergent Journalism an Introduction: Writing and Producing Across Media (Quinn & Filak)
Solution Manual Flash Journalism : How to Create Multimedia News Packages (Mindy McAdams)

1634. 4145 Solution manuals & Test banks to Math, Statistics and Probability Books - part1

Newsgroup: rec.radio.amateur.antenna
Date: 2012-07-04 07:53:46 UTC
From: rodwes15@gmail.com
Message-ID: <8b27d6fd-2883-4eca-9801-d7b8db5c2f48@googlegroups.com>
Source record: 1550

List of Solutions Manuals and Test Banks

---

contact to : mattosbw1@gmail.com mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

I do not review the forums, just send me an email. Please do not use emails from servers "LIVE" , all they are take as spam emails in my inbox.

- Math, Statistics & Probability :

Solution manual Advanced Engineering Mathematics (8th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (9th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (10th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (2nd Ed, Michael Greenberg)
Solution manual Advanced Engineering Mathematics (6th Ed., Peter O'Neil)
Solution manual Statistics and Finance : An Introduction (David Ruppert)
Solution manual Differential Equations for Engineers and Scientists (Yunus A. Cengel, William J. Palm III)
Solution manual Mathematics for Carpentry and the Construction Trades (3rd Ed., Alfred P. Webster & Kathryn E. Bright)
Solution manual Calculus : Early Transcendental Functions (3rd Ed., Robert T. Smith & Roland B. Minton)
Solution manual Calculus : Early Transcendental Functions (4th Ed., Robert T. Smith & Roland B. Minton)
Solution manual Elements of Engineering Probability and Statistics (Rodger E. Ziemer)
Solution manual Statistics and Probability for Engineers and Scientists, Preliminary Edition (Bhisham C. Gupta, Irwin Guttman)
Solution manual Statistics and Data Analysis : From Elementary to Intermediate (Ajit Tamhane, Dorothy Dunlop)
Solution manual Statistics and Data Analysis for Financial Engineering (David Ruppert)
Solution manual Mathematical Physics with Partial Differential Equations (James Kirkwood)
Solution manual Essential Statistics, Regression, and Econometrics (Gary Smith)
Solution manual Mathematical Methods for Physicists : A Comprehensive Guide (7th Ed., George Arfken, Hans Weber & Frank Harris)
Solution manual Statistics for Physical Sciences - An Introduction (Brian Martin)
Solution Manual Mathematical Statistics for Economics and Business (Ron C. Mittelhammer)

Solution manual Advanced Modern Engineering Mathematics (3rd Ed., Glyn James)
Solution manual Modern Engineering Mathematics (4th Ed., Glyn James)
Solution manual Differential Equations and Dynamical Systems (3rd Ed., Lawrence Perko)
Solution manual Introductory Differential Equations with Boundary Value Problems (3rd Ed., Martha Abell & James Braselton)
Solution manual A Modern Introduction to Differential Equations (2nd Ed., Henry J. Ricardo)
Solution manual Elementary Differential Equations (7th Ed., Boyce)
Solution manual Elementary Differential Equations (8th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations (9th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (7th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (8th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (9th Ed., Boyce & Diprima)
Solution manual Differential Equations : An Introduction to Modern Methods and Applications (James Brannan & William Boyce)
Solution manual Differential Equations with Boundary Value Problems : An Introduction to Modern Methods and Applications (James Brannan & William Boyce)
Solution manual An Introduction to Mathematical Cryptography (J. Hoffstein, J. Pipher, J.H. Silverman)
Solution manual Practical Business Statistics (Andrew Siegel)
Solution manual Advanced Calculus : A Transition to Analysis (Thomas Dence & Joseph Dence)
Solution manual Calculus : Early Transcendentals Combined (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Combined (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Multivariable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Multivariable (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Single Variable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Single Variable (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Combined (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Combined (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Single Variable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Single Variable (9th Ed., Anton, Bivens & Davis)
Solution manual Introduction to the Finite Element Method : Theory, Programming and Applications (Erik G. Thompson)
Solution manual A Physicist's Guide to Mathematica (2nd Ed., Patrick Tam)
Solution manual Mathematics for Engineers : A Modern Interactive Approach (3rd., Anthony Croft & Robert Davison)
Solution manual Measurement and Data Analysis for Engineering and Science (Patrick F Dunn)
Solution manual Elementary Linear Algebra (4th Ed., Stephen Andrilli & David Hecker)
Solution manual Elementary Linear Algebra Edition Abridged (9th Ed., Anton & Rorres)
Solution manual Elementary Linear Algebra (9th Ed., Anton)
Solution manual Elementary Linear Algebra with Applications (9th Ed., Anton & Rorres)
Solution manual Boundary Value Problems and Partial Differential Equations (6th Ed., David Powers)
Solution manual Introductory Statistics : Using Technology (5th Ed., Prem S. Mann)

Solution manual Introductory Statistics (6th Ed., Prem S. Mann)
Solution manual Introductory Statistics (7th Ed., Prem S. Mann)
Solution manual Basic Real Analysis (Houshang H. Sohrab)
Solution manual Essentials of Integration Theory for Analysis (Daniel W. Stroock)
Solution manual Statistical Methods (3rd Ed., Rudolf Freund, Donna Mohr, William Wilson)
Solution manual Doing Bayesian Data Analysis : A Tutorial Introduction with R (John Kruschke)
Solution manual Modern Algebra : An Introduction (6th Ed., John Durbin)
Solution manual The Art and Craft of Problem Solving (2nd Ed., Paul Zeitz)
Solution manual Numerical Linear Algebra (Grégoire Allaire, Sidi Mahmoud Kaber, K. Trabelsi)
Solution manual Introductory Statistics for the Behavioral Sciences (6th Ed., Welkowitz, Cohen & Ewen)
Solution manual Statistics : Principles and Methods (5th Ed., Richard Johnson)
Solution manual Statistics : Principles and Methods (6th Ed., Richard Johnson)
Solution manual Statistical Bioinformatics : with R (Sunil K. Mathur)
Solution manual A Modern Introduction to Differential Equations (2nd Ed., Henry Ricardo)
Solution manual Parameter Estimation and Inverse Problems (Richard Aster, Brian Borchers & Clifford Thurber)
Solution manual Parameter Estimation and Inverse Problems (2nd Ed., Richard Aster, Brian Borchers & Clifford Thurber)
Solution manual Codes : An Introduction to Information Communication and Cryptography (Norman L. Biggs)
Solution manual Geometry and Its Applications (2nd Ed., Walter A. Meyer)
Solution manual Elementary Differential Geometry (2nd Ed., A.N. Pressley)
Solution manual Fractal Geometry : Mathematical Foundations and Applications (2nd Ed., Kenneth Falconer)
Solution manual Analytical and Computational Methods of Advanced Engineering Mathematics (Grant B. Gustafson & Calvin H. Wilcox)
Solution manual How to Read and Do Proofs : An Introduction to Mathematical Thought Processes (4th Ed., Daniel Solow)
Solution manual How to Read and Do Proofs : An Introduction to Mathematical Thought Processes (5th Ed., Daniel Solow)
Solution manual A Probability Path (Sidney Resnick)
Solution manual Probability, Reliability, and Statistical Methods in Engineering Design (Achintya Haldar, Sankaran Mahadevan)
Solution manual An Engineers Guide to MATLAB (3rd Ed., Magrab, Azarm, Balachandran, Duncan, Herold & Walsh)
Solution manual Intuitive Probability and Random Processes using MATLAB (Steven Kay)
Solution manual Modeling Random Processes for Engineers and Managers (James Solberg)
Solution manual Probability and Random Processes with Applications to Signal Processing (3rd Ed., Henry Stark & John W. Woods)
Solution manual Probability, Statistics, and Random Processes for Engineers (4th Ed., Henry Stark & John W. Woods)
Solution manual Probability, Statistics, and Random Processes For Electrical Engineering (3rd Ed., Alberto Leon-Garcia)
Solution manual Probability Concepts in Engineering : Emphasis on Applications to Civil and Environmental Engineering (2nd Ed., Ang & Tang)
Solution manual Applied Statistics for Engineers and Physical Scientists (3rd Ed., Johannes Ledolter & Robert Hogg)

Solution manual Applied Statistics and Probability for Engineers (3rd Ed., Montgomery & Runger)
Solution manual Applied Statistics and Probability for Engineers (4th Ed., Montgomery & Runger)
Solution manual Applied Statistics and Probability for Engineers (5th Ed., Montgomery & Runger)
Solution manual Engineering Statistics (3rd Ed., Montgomery, Runger & Hubele)
Solution manual Engineering Statistics (4th Ed., Montgomery, Runger & Hubele)
Solution manual Engineering Statistics (5th Ed., Montgomery, Runger & Hubele)
Solution manual Introduction to Statistical Quality Control (5th Ed., Montgomery)
Solution manual Introduction to Statistical Quality Control (6th Ed., Montgomery)
Solution manual Calculus : One Variables (10th Ed., Salas, Hille, Etgen)
Solution manual Calculus : One and Several Variables (8th Ed., Salas, Hille, Etgen)
Solution manual Calculus : One and Several Variables (10th Ed., Salas, Hille, Etgen)
Solution manual Squaring the Circle : Geometry in Art and Architecture (Paul Calter)
Solution manual Technical Mathematics (5th Ed., Paul Calter & Michael Calter)
Solution manual Technical Mathematics with Calculus (5th Ed., Paul Calter & Michael Calter)
Solution manual Technical Mathematics with Calculus, Canadian Edition (Paul Calter & Michael Calter)
Solution manual Technical Mathematics with Calculus (6th Ed., Paul Calter & Michael Calter)
Solution manual Techniques of Problem Solving (Luis Fernández, Haedeh Gooransarab)
Solution manual Probability and Statistics in Engineering (4th Ed., Hines, Montgomery, Goldsman & Borror)
Solution manual A First Course in Design and Analysis of Experiments (Gary W. Oehlert)
Solution manual Design and Analysis of Experiments (6th Ed., Douglas Montgomery)
Solution manual Design and Analysis of Experiments (7th Ed., Douglas Montgomery)
Solution Manual Experimental Methods for Engineers (8th Ed., Jack P. Holman)
Solution manual Introduction to Engineering Experimentation (2nd Ed., Wheeler & Ganji)
Solution manual Introduction to Engineering Experimentation (3rd Ed., Wheeler & Ganji)
Solution manual Introduction to the Design & Analysis of Experiments (Canavos & Koutrouvelis)
Solution manual Modern Methods For Quality Control and Improvement (2nd Ed., Wadsworth, Stephens, Godfrey)
Solution manual Essential Statistics for Economics, Business and Management (Teresa Bradley)
Solution manual Statistics and Econometrics : Methods and Applications (Ashenfelter, Levine & Zimmerman)
Solution manual Applied Combinatorics (5th Ed., Alan Tucker)
Solution manual Applied Combinatorics (6th Ed., Alan Tucker)
Solution manual Vector Calculus (Miroslav Lovric)
Solution manual Applied Multivariate Techniques (Subhash Sharma)
Solution manual Mathematical Modeling (3rd Ed., Mark Meerschaert)
Solution manual Discrete Mathematics : Mathematical Reasoning and Proof with Puzzles, Patterns, and Games (Douglas Ensley, J. Winston Crawley)
Solution manual Probability, Random Variables and Random Signal Principles (4th Ed., Peyton Z., Jr. Peebles)
Solution manual Introduction to C++, Excel MATLAB & Basic Engineering Numerical Methods V1.1 (Harvey Stenger & Charles Smith)
Solution manual Numerical Methods for Engineers and Scientists : An Introduction with Applications Using MATLAB (1st Ed., Amos Gilat & Vish Subramaniam)

Solution manual Numerical Methods for Engineers and Scientists : An Introduction with Applications Using MATLAB (2nd Ed., Amos Gilat & Vish Subramaniam)
Solution manual MATLAB : An Introduction with Applications (2nd Ed., Amos Gilat)
Solution manual MATLAB : An Introduction with Applications (3rd Ed., Amos Gilat)
Solution manual MATLAB : An Introduction with Applications (4th Ed., Amos Gilat)
Solution manual Matlab : A Practical Introduction to Programming and Problem Solving (Stormy Attaway)
Solution manual Matlab : A Practical Introduction to Programming and Problem Solving (2nd Ed., Stormy Attaway)
Solution manual Data, Statistics, and Decision Models with Excel (Harnett & Horrell)
Solution manual Understanding Analysis (Stephen Abbott)
Solution manual Time Series Analysis With Applications in R (2nd Ed., Jonathan D. Cryer & Kung-Sik Chan)
Solution manual Time Series Analysis and Its Applications : With R Examples (2nd Ed., Robert Shumway & David Stoffer)
Solution manual Doing Statistics for Business with Excel : Data, Inference, and Decision Making (2nd Ed. Pelosi & Sandifer)
Solution manual Engineering with Excel (3rd Ed., Ronald W. Larsen)
Solution manual Spreadsheet Tools for Engineers Using Excel 2007 (Byron Gottfried)
Solution manual Spreadsheet Tools for Engineers using Excel (2nd Ed. Byron Gottfried)
Solution manual Spreadsheet Tools for Engineers using Excel (3rd Ed. Byron Gottfried)
Solution manual Introduction to Matlab 7 (Etter, Kuncicky & Moore)
Solution manual Introduction to Matlab 6 for Engineers (1st Ed., William Palm III)
Solution manual Introduction to Matlab 7 for Engineers (2nd Ed., William Palm III)
Solution manual Introduction to Matlab for Engineers (3rd Ed., William Palm III)
Solution manual A Concise Introduction to MATLAB (William J Palm III)
Solution manual Numerical Methods for Engineers (Bilal M. Ayyub, Richard H. McCuen)
Solution manual Numerical Methods for Engineers (4th Ed. Steven Chapra, Raymond Canale)
Solution manual Numerical Methods for Engineers (5th Ed. Steven Chapra, Raymond Canale)
Solution manual Numerical Methods for Engineers (6th Ed. Steven Chapra, Raymond Canale)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (1st Ed., Steven Chapra)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (2nd Ed., Steven Chapra)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (3rd Ed., Steven Chapra)
Solution manual MATLAB for Engineers (1st Ed., Holly Moore)
Solution manual MATLAB for Engineers (2nd Ed., Holly Moore)
Solution manual Statistics for Engineers and Scientists (1st Ed., William Navidi)
Solution manual Statistics for Engineers and Scientists (2nd Ed., William Navidi)
Solution manual Statistics for Engineers and Scientists (3rd Ed., William Navidi)
Solution manual Principles of Statistics for Engineers and Scientists (William Navidi)
Solution manual Elementary Statistics (1st Ed., William Navidi, Barry Monk)
Solution manual Probability (Jim Pitman)
Solution manual Basic Probability Theory (Robert B. Ash)
Solution manual An Introduction to Stochastic Modeling (3rd Ed., Samuel Karlin & Howard M. Taylor)
Solution manual An Introduction to Stochastic Modeling (4th Ed., Mark Pinsky & Samuel Karlin)
Solution manual Stochastic Calculus for Finance (Steven E. Shreve)

Solution manual Markov Processes for Stochastic Modeling (Oliver Ibe)
Solution manual Mathematical Statistics with Applications (K.M. Ramachandran & Chris Tsokos)
Solution manual Probability : A Graduate Course (Allan Gut)
Solution manual Linear Algebra Done Right (2nd Ed., Sheldon Axler)
Solution manual Precalculus : A Prelude to Calculus (Sheldon Axler)
Solution manual Statistics for Business (Derek Waller)
Solution manual An Introduction to the Mathematics of Financial Derivatives (2nd Ed., Salih Neftci)
Solution manual Elementary Number Theory with Applications (2nd Ed., Thomas Koshy)
Solution manual Introduction to Probability Models (9th Ed., Sheldon Ross)
Solution manual Introduction to Probability Models (10th Ed., Sheldon Ross)
Solution manual Introductory Statistics (2nd Ed., Sheldon Ross)
Solution manual Introductory Statistics (3rd Ed., Sheldon Ross)
Solution manual Introduction to Probability and Statistics for Engineers and Scientists (4th Ed., Sheldon Ross)
Solution manual Basic Mathematics through Applications (4th Ed. by Akst, Bragg)
Solution manual Developmental Mathematics (6th Ed., Bittinger & Beecher)
Solution manual Developmental Mathematics (7th Ed., Bittinger & Beecher)
Solution manual Developmental Mathematics : Basic Mathematics and Algebra (1st Ed., Lial, Hornsby, McGinnis, Salzman & Hestwood)
Solution manual Developmental Mathematics : Basic Mathematics and Algebra (2nd Ed., Lial, Hornsby, McGinnis, Salzman & Hestwood)
Solution manual Essential Mathematics (2nd Ed., Margaret Lial & Stanley Salzman)
Solution manual Essential Mathematics (3rd Ed., Margaret Lial & Stanley Salzman)
Solution manual Prealgebra & Introductory Algebra (2nd Ed. by Elayn El Martin-Gay)
Solution manual Prealgebra (5th Ed., Bittinger, Ellenbogen & Johnson)
Solution manual Prealgebra (5th Ed., Elayn El Martin-Gay)
Solution manual Prealgebra : An Integrated Approach (Lial & Hestwood)
Solution manual Integrated Arithmetic and Basic Algebra (4th Ed., Jordan & Palow)
Solution manual Introductory Algebra through Applications (1st Ed., Akst & Bragg)
Solution manual Introductory Algebra through Applications (2nd Ed., Akst & Bragg)
Solution manual Beginning Algebra (10th Ed., Lial, Hornsby & McGinnis)
Solution manual Elementary Algebra Early Graphing for College Students (3rd Ed., Allen R. Angel)
Solution manual Intermediate Algebra with Applications & Visualization (3rd Ed., Rockswold & Krieger)
Solution manual Intermediate Algebra (10th Ed., Lial, Hornsby & McGinnis)
Solution manual Beginning and Intermediate Algebra (4th Ed., Lial, Hornsby & McGinnis)
Solution manual Elementary and Intermediate Algebra : Graphs & Models (3rd Ed., Bittinger, Ellenbogen & Johnson)
Solution manual Algebra for College Students (4th Ed., Mark Dugopolski)
Solution manual Algebra for College Students (5th Ed., Mark Dugopolski)
Solution manual Algebra For College Students (6th Ed., Robert F Blitzer)
Solution manual Algebra for College Students (3rd Ed., Allen R. Angel)
Solution manual Algebra for College Students (6th Ed., Lial, Hornsby & McGinnis)
Solution manual Statistics, Data Analysis, and Decision Modeling (3rd Ed., James Evans)
Solution manual Statistics, Data Analysis, and Decision Modeling (4th Ed., James Evans)
Solution manual College Geometry : A Discovery Approach (2nd Ed., David Kay)
Solution manual College Geometry : Using The Geometer's Sketchpad - Preliminary Edition

(Barbara Reynolds & William Fenton)
Solution manual College Geometry : A Problem Solving Approach with Applications (2nd Ed., Musser, Trimpe & Maurer)
Solution manual A Survey of Mathematics with Applications (8th Ed., Angel, Abbott & Runde)
Solution manual A Survey of Mathematics with Applications: Expanded Edition (8th Ed., Angel, Abbott & Runde)
Solution manual Mathematical Ideas (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas: Expanded Edition (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Thinking : Problem-Solving and Proofs (2nd Ed., John P. D'Angelo & Douglas B. West)
Solution manual Thinking Mathematically (4th Ed., Robert F. Blitzer)
Solution manual Introduction to Mathematical Thinking: Algebra and Number Systems (Will J. Gilbert & Scott A. Vanstone)
Solution manual Mathematical Reasoning : Writing and Proof (1st Ed., Ted A. Sundstrom)
Solution manual Mathematical Reasoning : Writing and Proof (2nd Ed., Ted A. Sundstrom)
Solution manual Mathematical Reasoning for Elementary Teachers (4th Ed., Calvin T. Long & Duane W. DeTemple)
Solution manual Mathematical Reasoning for Elementary Teachers (5th Ed., Long, DeTemple & Millman)
Solution manual Mathematics for Elementary School Teachers (4th Ed., O'Daffer, Charles, Cooney, Dossey & Schielack)
Solution manual Mathematics for Elementary Teachers (2nd Ed., Sybilla Beckmann)
Solution manual Finite Mathematics and Calculus with Applications (7th Ed., Lial, Greenwell & Ritchey)
Solution manual Finite Mathematics and Calculus with Applications (8th Ed., Lial, Greenwell & Ritchey)
Solution manual Additional Calculus Topics (11th Ed., Barnett, Ziegler & Byleen)
Solution manual College Mathematics for Business, Economics, Life Sciences & Social Sciences (11th Ed., Barnett, Ziegler & Byleen)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and Social Sciences (12th Ed., Haeussler, Paul & Wood)
Solution manual Finite Mathematics for Business, Economics, Life Sciences and Social Sciences (11th Ed., Barnett, Ziegler, Byleen)
Solution manual Finite Mathematics (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Calculus and Its Applications (9th Ed., Bittinger & Ellenbogen)
Solution manual Calculus for Business, Economics, Life Sciences & Social Sciences (11th Ed., Barnett, Ziegler & Byleen)
Solution manual Calculus with Applications (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Calculus with Applications : Brief Version (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Concepts of Calculus with Applications (Martha Goshaw)
Solution manual University Calculus : Elements with Early Transcendentals (Hass, Weir & Thomas, Jr.)
Solution manual Thomas' Calculus, Early Transcendentals: Media Upgrade (11th Ed., Thomas Jr., Weir, Hass & Giordano)
Solution manual Thomas' Calculus: Media Upgrade (11th Ed., Thomas Jr., Weir, Hass & Giordano)
Solution manual University Calculus : Alternate Edition (Hass, Weir & Thomas, Jr.)
Solution manual Differential Equations Computing and Modeling (4th Ed., Edwards & Penney)
Solution manual Differential Equations and Boundary Value Problems : Computing and Modeling (4th Ed., Edwards & Penney)

Solution manual Elementary Differential Equations with Boundary Value Problems (6th Ed., Edwards & Penney)
Solution manual Elementary Differential Equations (6th Ed., Edwards & Penney)
Solution manual Fundamentals of Differential Equations (7th Ed., Nagle, Saff & Snider)
Solution manual Fundamentals of Differential Equations with Boundary Value Problems (5th Ed., Nagle, Saff & Snider)
Solution manual Differential Equations and Linear Algebra (3rd Ed., Goode & Annin)
Solution manual College Algebra with Trigonometry (9th Ed., Raymond A. Barnett)
Solution manual College Algebra Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual College Algebra (10th Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra : Graphs and Models (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual College Algebra : Graphs and Models (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual College Algebra Essentials (8th Ed., Michael Sullivan)
Solution manual College Algebra (3rd Ed., Judith A. Beecher, Judith A. Penna & Marvin L. Bittinger)
Solution manual College Algebra (8th Ed., Michael Sullivan)
Solution manual College Algebra (9th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry for College Readiness (Margaret L. Lial & John Hornsby)
Solution manual Algebra and Trigonometry Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual Algebra and Trigonometry : Graphs & Models (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Trigonometry : A Unit Circle Approach (8th Ed., Michael Sullivan)
Solution manual Precalculus (3rd Ed., Lial, Hornsby & Schneider)
Solution manual Precalculus (4th Ed., Lial, Hornsby & Schneider)
Solution manual Precalculus : Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual Precalculus : Functions and Graphs (3rd Ed. Mark Dugopolski)
Solution manual Precalculus : Graphs & Models and Graphing (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Discrete and Combinatorial Mathematics (5th ed., Ralph P. Grimaldi)
Solution manual Discrete Mathematics (Sherwood Washburn, Thomas Marlowe & Charles T. Ryan)
Solution manual Discrete Mathematics (5th ed., John Dossey, Albert Otto, Lawrence Spence & Charles Vanden Eynden)
Solution manual Mathematics for New Technologies (Don Hutchison & Mark Yannotta)
Solution manual Fundamental Finite Element Analysis and Applications: with Mathematica and Matlab Computations (Asghar Bhatti)
Solution manual Advanced Topics in Finite Element Analysis of Structures: With Mathematica and MATLAB Computations (Asghar Bhatti)
Solution manual The Finite Element Method in Engineering (4th Ed., by Rao)
Solution manual An Introduction to the Finite Element Method (3rd Ed., J. N. Reddy)
Solution manual Fundamentals of Finite Element Analysis (1st Ed., David V. Hutton)
Solution manual Simulation Modeling and Analysis (3rd Ed., Averill Law & David Kelton)
Solution manual Simulation Modeling and Analysis (4th Ed., Averill Law)
Solution manual The Finite Element Method : Its Basis and Fundamentals (6th Ed., Zienkiewicz, R. L. Taylor & J.Z. Zhu)

Solution manual Algebra : Form and Function (William McCallum, Eric Connally & Deborah Hughes-Hallett)
Solution manual Algebra : Form and Function, Preliminary Edition (William McCallum, Eric Connally & Deborah Hughes-Hallett)
Solution manual Applied Calculus (2nd Ed., Deborah Hughes-Hallett, et al.)
Solution manual Applied Calculus (3rd Ed., Deborah Hughes-Hallett, et al.)
Solution manual Applied Calculus (4th Ed., Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (3rd Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (4th Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (5th Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Single Variable (3rd Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single Variable (4th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single Variable (5th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (3rd Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (4th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (5th Ed., Deborah Hughes-Hallett)
Solution manual Functions Modeling Change : A Preparation for Calculus - Texas Edition (2nd Ed., Eric Connally, Deborah Hughes-Hallett & Andrew M. Gleason)
Solution manual Functions Modeling Change : A Preparation for Calculus (2nd Ed., Eric Connally, Deborah Hughes-Hallett, et al.)
Solution manual Functions Modeling Change : A Preparation for Calculus (3rd Ed., Eric Connally)
Solution manual Differential Equations (A. King, J. Billingham, S. Otto)
Solution manual Regression Methods in Biostatistics : Linear, Logistic, Survival, and Repeated Measures Models (Eric Vittinghoff, David Glidden, Stephen Shiboski, Charles McCulloch)
Solution manual A Modern Introduction to Probability and Statistics : Understanding Why and How (F.M. Dekking, C. Kraaikamp, H.P. Lopuhaä, L.E. Meester)
Solution manual Statistical Methods for the Analysis of Repeated Measurements (Charles S. Davis)
Solution manual Bayesian Core : A Practical Approach to Computational Bayesian Statistics (Jean-Michel Marin, Christian Robert)
Solution manual The Bayesian Choice : From Decision-Theoretic Foundations to Computational Implementation (2nd Ed., Christian Robert)
Solution manual Essentials of Stochastic Processes (Rick Durrett)
Solution manual Methods of Multivariate Statistics (Muni Srivastava)
Solution manual Regression Analysis : Theory, Methods, and Applications (Ashish Sen & Muni Srivastava)
Solution manual Applied Probability and Statistics (Mario Lefebvre)
Solution manual Basic Probability Theory with Applications (Mario Lefebvre)
Solution manual Foundations of Hyperbolic Manifolds (2nd Ed., John Ratcliffe)
Solution manual Fourier and Laplace Transforms (R. J. Beerends , H. G. ter Morsche)

Solution manual Infinite-Dimensional Dynamical Systems (James C. Robinson)
Solution manual Mathematical Methods for Physics and Engineering, (3rd Ed., Riley, Hobson & Bence)
Solution manual Numerical Methods in Engineering with MATLAB (Jaan Kiusalaas)
Solution manual Numerical Methods in Engineering with Python (Jaan Kiusalaas)
Solution manual An Introduction to Numerical Analysis (Endre Suli and David Mayers)
Solution manual Fundamentals of Engineering Numerical Analysis (Parviz Moin)
Solution manual Statistical Design (George Casella)
Solution manual Statistical Inference (2nd Ed., George Casella, Roger L. Berger)
Solution manual Monte Carlo Statistical Methods (2nd Ed., Christian P. Robert, George Casella)
Solution manual Introducing Monte Carlo Methods with R (Christian Robert & George Casella)
Solution manual Introduction to Mathematical Structures and Proofs (Larry J. Gerstein)
Solution manual Analyzing Categorical Data (Jeffrey S. Simonoff)
Solution manual Fundamentals of Complex Analysis with Applications to Engineering, Science, and Mathematics (3rd Ed., E. Saff & Arthur Snider)
Solution manual Probability & Statistics for Engineers & Scientists (8th Ed., Walpole, Myers, Ye)
Solution manual Probability & Statistics for Engineers & Scientists (9th Ed., Walpole, Myers, Ye)
Solution manual Statistics for Engineering and the Sciences (5th Ed., Mendenhall & Sincich)

List of Solutions Manuals and Test Banks

---

contact to : mattosbw1@gmail.com mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

I do not review the forums, just send me an email. Please do not use emails from servers "LIVE" , all they are take as spam emails in my inbox.

- Math, Statistics & Probability :

Solution manual A Second Course in Statistics : Regression Analysis (6th Ed., Mendenhall & Sincich)
Solution manual A Second Course in Statistics : Regression Analysis (7th Ed., Mendenhall & Sincich)
Solution manual Miller & Freund's Probability and Statistics for Engineers (7th Ed., Johnson, Miller, Freund)
Solution manual Miller & Freund's Probability and Statistics for Engineers (8th Ed., Johnson, Miller, Freund)
Solution manual Numerical Methods Using Matlab (4th Ed., Mathews & Fink)
Solution manual Applied Numerical Analysis Using MATLAB (2nd Ed., Laurene v. Fausett)
Solution manual Applied Numerical Analysis (7th Ed., Curtis F. Gerald, Patrick O. Wheatley)
Solution manual Friendly Introduction to Numerical Analysis (Bradie)
Solution manual Elementary Linear Algebra (2nd Ed., Spence, Insel & Friedberg)
Solution manual Elementary Linear Algebra with Applications (9th Ed., Kolman & Hill)
Solution manual Introductory Linear Algebra : An Applied First Course (8th Ed., Kolman & Hill)
Solution manual Linear Algebra with Applications (6th Ed., S. Leon)
Solution manual Linear Algebra with Applications (7th Ed., S. Leon)
Solution manual Linear Algebra with Applications (8th Ed., S. Leon)
Solution manual Linear Algebra for Engineers and Scientists Using Matlab (Hardy)
Solution manual Linear Algebra with Applications (3rd Ed., Bretscher)
Solution manual Linear Algebra with Applications (4th Ed., Bretscher)
Solution manual Modern Matrix Algebra (Hill & Kolman)
Solution manual Matrix Methods : Applied Linear Algebra (3rd Ed., Richard Bronson & Gabriel B. Costa)
Solution manual A Transition to Abstract Mathematics : Learning Mathematical Thinking and

Writing (2nd Ed., Randall Maddox)
Solution manual Partial Differential Equations and Boundary Value Problems with Fourier Series (2nd ed., Asmar)
Solution manual Applied Partial Differential Equations (4th Ed., Haberman)
Solution manual Technical Calculus (5th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Technical Mathematics (2th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Technical Mathematics with Calculus (2th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Introductory Mathematics (4th Ed., Cook)
Solution manual Mathematics for the Technical Trades (Cook)
Solution manual College Mathematics (7th Ed., Cleaves & Hobbs)
Solution manual Fundamentals of Statistics (2nd Ed., Michael III Sullivan)
Solution manual Fundamentals of Statistics (3rd Ed., Michael III Sullivan)
Solution manual Statistics : Informed Decisions Using Data (2nd Ed., Michael III Sullivan)
Solution manual Statistics : Informed Decisions Using Data (3rd Ed., Michael III Sullivan)
Solution manual Statistics : Informed Decisions Using Data (4th Ed., Michael III Sullivan)
Solution manual Modern Elementary Statistics (12th Ed., John E. Freund, Benjamin M. Perles)
Solution manual Statistics : The Art and Science of Learning From Data (Agresti & Franklin)
Solution manual Statistics : The Art and Science of Learning From Data (2nd Ed., Agresti & Franklin)
Solution manual Statistics : The Art and Science of Learning From Data (3rd Ed., Agresti & Franklin)
Solution manual Elementary Statistics : Picturing the World (3rd Ed., Larson & Farber)
Solution manual Elementary Statistics : Picturing the World (4th Ed., Larson & Farber)
Solution manual Elementary Statistics : Picturing the World (5th Ed., Larson & Farber)
Solution manual A First Course in Statistics (9th Ed., McClave & Sincich)
Solution manual A First Course in Statistics (10th Ed., McClave & Sincich)
Solution manual A First Course in Statistics (11th Ed., McClave & Sincich)
Solution manual Statistics (10th Ed., McClave & Terry Sincich)
Solution manual Statistics (11th Ed., McClave & Terry Sincich & William Mendenhall)
Solution manual Statistics (12th Ed., McClave & Terry Sincich)
Solution manual Interactive Statistics (3rd Ed., Martha Aliaga & Brenda Gunderson)
Solution manual Statistics for the Life Sciences (3rd Ed., Samuels & Witmer)
Solution manual Statistics for the Life Sciences (4th Ed., Samuels, Witmer & Schaffner)
Solution manual Applied Statistics and the SAS Programming Language (5th Ed., Cody & Smith)
Solution manual Biostatistics for the Health Sciences (R. Clifford Blair & Richard Taylor)
Solution manual Biostatistics : How It Works (Steve Selvin)
Solution manual Business Statistics : First Course (4th Ed., Levine, Krehbiel & Berenson)
Solution manual Business Statistics : First Course (5th Ed., Levine, Krehbiel & Berenson)
Solution manual Course in Business Statistics (4th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision Making Approach (6th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision-Making Approach (7th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision-Making Approach (8th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Statistics for Business & Economics (10th Ed., McClave, Benson & Sincich)
Solution manual Statistics for Managers Using Excel (5th Ed., Levine)
Solution manual Statistics for Managers Using Microsoft Excel (4th Ed., Levine, Stephan, Krehbiel & Berenson)

Solution manual Statistics for Business and Economics (5th Ed., Newbold, Carlson & Thorne)
Solution manual Statistics for Business and Economics (6th Ed., Newbold, Carlson & Thorne)
Solution manual Statistics for Business and Economics (7th Ed., Newbold, Carlson & Thorne)
Solution manual Basic Business Statistics : Concepts and Applications (10th Ed., Berenson, Krehbiel & Levine)
Solution manual Basic Business Statistics (11th Ed., Berenson, Levine & Krehbiel)
Solution manual John E. Freund's Mathematical Statistics with Applications (7th Ed., Miller)
Solution manual Probability and Statistical Inference (7th Ed., Hogg & Tanis)
Solution manual Probability and Statistical Inference (8th Ed., Hogg & Tanis)
Solution manual Introduction to Mathematical Statistics (6th Ed., Hogg, Craig & McKean)
Solution manual Introduction to Mathematical Statistics (7th Ed., Hogg, Craig & McKean)
Solution manual Introduction to Mathematical Statistics and Its Applications (4th Ed., Larsen & Marx)
Solution manual Introduction to Mathematical Statistics and Its Applications (5th Ed., Larsen & Marx)
Solution manual A Brief Course in Mathematical Statistics (Hogg & Tanis)
Solution manual Fundamentals of Probability, with Stochastic Processes (3rd Ed., Saeed Ghahramani)
Solution manual A First Course in Probability (7th Ed., Sheldon Ross)
Solution manual A First Course in Probability (8th Ed., Sheldon Ross)
Solution manual Applied Multivariate Statistical Analysis (6th Ed., Johnson & Wichern)
Solution manual Multivariate Data Analysis (6th Ed., Hair, Black, Babin, Anderson & Tatham)
Solution manual Multivariate Data Analysis (7th Ed., Hair, Black, Babin, Anderson)
Solution manual Essential MATLAB for Engineers and Scientists (3rd Ed., Brian Hahn & Dan Valentine)
Solution manual Essential MATLAB for Engineers and Scientists (4th Ed., Brian Hahn & Dan Valentine)
Solution manual Introduction to Applied Statistical Signal Analysis : Guide to Biomedical and Electrical Engineering Applications (3rd Ed. Richard Shiavi)
Solution manual Construction Mathematics (Surinder Virdi & Roy Baker)
Solution manual Numerical Methods in Biomedical Engineering (Stanley Dunn, Alkis Constantinides & Prabhas Moghe)
Solution manual Probability and Statistics with Integrated Software Routines (Ronald Deep)
Solution manual Finite Element Analysis with Error Estimators : An Introduction to the FEM and Adaptive Error Analysis for Engineering Students (J. Akin)
Solution manual Basic Engineering Mathematics (4th Ed., John Bird)
Solution manual Engineering Mathematics (4th Ed., John Bird)
Solution manual Engineering Mathematics (5th Ed., John Bird)
Solution manual Higher Engineering Mathematics (5th Ed., John Bird)
Solution manual Construction Mathematics (Virdi & Baker)
Solution manual Mathematics for Electrical Engineering and Computing (Mary Attenborough)
Solution manual Probability and Random Processes : With Applications to Signal Processing and Communications (Miller & Childers)
Solution manual Introductory Statistics for Engineering Experimentation (Peter Nelson, Karen Copeland & Marie Coffin)
Solution manual Understanding Engineering Mathematics (Bill Cox)
Solution manual Statistics And Probability For Engineering Applications With Microsoft Excel (Decoursey)
Solution manual Business Math Using Calculators : With 10-Key Computer Assisted

Instruction (Burton)
Solution manual Mathematics for Economics and Business (5th Ed., Ian Jacques)
Solution manual Business Math, Brief (7th Ed., Cleaves & Hobbs)
Solution manual Math for Merchandising: A Step-by-Step Approach (3rd Ed., Moore)
Solution manual Mathematics for Business (7th Ed., Salzman , Miller & Clendenen)
Solution manual Mathematics for Business (8th Ed., Salzman , Miller & Clendenen)
Solution manual Basic College Mathematics with Early Integers (K. Elayn Martin-Gay)
Solution manual Developmental Mathematics (K. Elayn Martin-Gay)
Solution manual An Introduction to Analysis (3rd Ed., William Wade)
Solution manual An Introduction to Analysis (4th Ed., William Wade)
Solution manual A Friendly Introduction to Analysis (2nd Ed., Witold A.J. Kosmala)
Solution manual Advanced Calculus (Gerald Folland)
Solution manual Analysis : With an Introduction to Proof (4th Ed., Steven R. Lay)
Solution manual Essentials of Basic College Mathematics (John Jr Tobey, Jr., Jeffrey Slater)
Solution manual Basic College Mathematics (5th Ed., John Tobey & Jeffrey Slater)
Solution manual Prealgebra (3rd Ed., Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Elementary Algebra Early Graphing for College Students (3rd Ed., Allen Angel)
Solution manual Elementary Algebra (Michael Sullivan III, Katherine R. Struve & Janet Mazzarella)
Solution manual Elementary Algebra for College Students (7th Ed., Allen R. Angel)
Solution manual Experiencing Introductory and Intermediate Algebra Through Functions and Graphs (3rd Ed., JoAnne Thomasson & Robert Pesut)
Solution manual Introductory Algebra (3rd Ed., K. Elayn Martin-Gay)
Solution manual Beginning Algebra (6th Ed., John Jr Tobey & Jeffrey Slater)
Solution manual Beginning Algebra : Early Graphing (Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Beginning and Intermediate Algebra (2nd Ed., Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Introductory Algebra (4th Ed., Robert Blitzer)
Solution manual Introductory and Intermediate Algebra (2nd Ed., Robert Blitzer)
Solution manual Intermediate Algebra for College Students (7th Ed., Allen Angel)
Solution manual Intermediate Algebra (Michael Sullivan III & Katherine Struve)
Solution manual Intermediate Algebra (3rd Ed., K. Elayn Martin-Gay)
Solution manual Essentials of Intermediate Algebra for College Students (Robert Blitzer)
Solution manual Intermediate Algebra (4th Ed., Robert Blitzer)
Solution manual Intermediate Algebra for College Students (5th Ed., Robert Blitzer)
Solution manual Algebra A Combined Approach (3rd Ed., K. Elayn Martin-Gay)
Solution manual Elementary & Intermediate Algebra (Michael Sullivan III, Katherine R. Struve & Janet Mazzarella)
Solution manual Essentials of Introductory and Intermediate Algebra for College Students (Robert F. Blitzer)
Solution manual Algebra for College Students (3rd Ed., Allen R. Angel)
Solution manual Algebra for College Students (5th Ed., Robert F Blitzer)
Solution manual College Algebra Essentials (8th Ed., Michael Sullivan)
Solution manual College Algebra (4th Ed., Robert Blitzer)
Solution manual College Algebra Essentials (2nd Ed., Robert F. Blitzer)
Solution manual College Algebra : An Early Functions Approach (Robert F. Blitzer)
Solution manual College Algebra : Concepts Through Functions (1st Ed., Michael Sullivan III & Michael Sullivan)

Solution manual College Algebra : Concepts Through Functions (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual College Algebra Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Essentials of College Algebra : Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Algebra and Trigonometry (8th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry (3rd Ed., Robert F. Blitzer)
Solution manual Algebra and Trigonometry: An Early Functions Approach (Robert Blitzer)
Solution manual Algebra & Trigonometry (7th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry Enhanced With Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Trigonometry (7th Ed., Michael Sullivan)
Solution manual Trigonometry (8th Ed., Michael Sullivan)
Solution manual Trigonometry Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus (8th Ed., Michael Sullivan)
Solution manual Precalculus (3rd Ed., Robert Blitzer)
Solution manual Precalculus (4th Ed., Robert Blitzer)
Solution manual Precalculus (1st Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual Precalculus : A Right Triangle Approach (2nd Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual Precalculus Essentials (2nd Ed., Robert Blitzer)
Solution manual Precalculus Essentials (3rd Ed., Robert Blitzer)
Solution manual Precalculus : Concepts Through Functions, A Unit Circle Approach to Trigonometry (1st Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Unit Circle Approach to Trigonometry (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Right Triangle Approach to Trigonometry (1st Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Right Triangle Approach to Trigonometry (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Enhanced with Graphing Utilities (5th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Essentials : Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Excursions in Modern Mathematics (5th Ed., Peter Tannenbaum)
Solution manual Excursions In Modern Mathematics with Mini-Excursions (6th Ed., Peter Tannenbaum)
Solution manual Quantitive Reasoning & the Environment (Greg Langkamp & Joseph Hull)
Solution manual Fundamentals of Mathematics (10th Ed., William M Setek & Michael A Gallo)
Solution manual Learning Math in Elementary and Middle School & IMAP Package (4th Ed., Cathcart, Pothier, Vance & Bezuk)
Solution manual Understanding the Math You Teach: Content and Methods for Prekindergarten Through Grade 4 (Anita C. Burris)
Solution manual Algebra Connections (Ira J. Papick & UMO University of Missouri)
Solution manual Calculus Connections (Asma Harcharras, Dorina Mitrea)
Solution manual Data Analysis and Probability Connections: Mathematics for Middle School

Teachers (Debra A. Perkowski & Michael Perkowski)
Solution manual Geometry Connections (John K. Beem)
Solution manual Elementary Math Modeling Updated (2nd Ed., Mary Ellen Davis & C. Henry Edwards)
Solution manual Additional Calculus Topics (11th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Finite Math and Its Application (9th Ed., Larry J Goldstein, David I Schneider & Martha J. Siegel)
Solution manual Finite Mathematics and Its Application (10th Ed., Larry J Goldstein, David I Schneider & Martha J. Siegel)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and social Sciences (11th Ed., Haeussler, Paul & R.J. Wood)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and Social Sciences (12th Ed., Haeussler, Paul & R.J. Wood)
Solution manual Additional Calculus Topics (9th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual College Mathematics for Business, Economics, Life Sciences and Social Sciences (10th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Brief Calculus and Its Applications (11th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Brief Calculus and Its Applications (12th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus and its Applications (10th Ed., Larry Goldstein, David Schneider, David Lay)
Solution manual Calculus and its Applications (11th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus and its Applications (12th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus for Business, Economics, Life Sciences and Social Sciences (10th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Calculus, Early Transcendentals (6th Ed., C. Henry Edwards & David Penney)
Solution manual Calculus, Early Transcendentals (7th Ed., C. Henry Edwards & David Penney)
Solution manual Calculus (9th Ed., Dale Varberg, Edwin Purcell & Steve Rigdon)
Solution manual Calculus Early Transcendentals (Dale Varberg, Edwin Purcell & Steve Rigdon)
Solution manual Calculus (3rd Ed., Monty Strauss, Gerald Bradley & Karl Smith)
Solution manual Calculus (6th Ed., Henry Edwards & David E. Penney)
Solution manual Single Variable Calculus (3rd Ed., Monty Strauss, Gerald Bradley & Karl Smith)
Solution manual Vector Calculus (3rd Ed., Susan Colley)
Solution manual Applied Linear Algebra (Peter Olver & Cheri Shakiban)
Solution manual Differential Equations and Linear Algebra (2nd Ed., Jerry Farlow, James E. Hall, Jean Marie McDill & Beverly West)
Solution manual Differential Equations and Linear Algebra (2nd Ed., C. Henry Edwards & David Penney)
Solution manual Differential Equations and Linear Algebra (3rd Ed., C. Henry Edwards & David Penney)
Solution manual Differential Equations (2nd Ed., John Polking, Al Boggess & David Arnold)
Solution manual Differential Equations with Boundary Value Problems (2nd ed., John Polking, Al Boggess & David Arnold)
Solution manual Discrete Mathematics with Graph Theory (3rd Ed., Edgar Goodaire & Michael

Parmenter)
Solution manual Essential Discrete Mathematics (Todd Feil & Joan Krone)
Solution manual Statistical Methods for the Social Sciences (4th Ed., Agresti & Finlay)
Solution manual A Brief Course in Mathematical Statistics (Tanis & Hogg)
Solution manual Business Mathematics, 10th Ed. (Miller, Salzman & Clendenen)
Solution manual Elementary Statistics (6th Ed., Weiss)
Solution manual Elementary Statistics (7th Ed., Weiss)
Solution manual Elementary Statistics (8th Ed., Weiss)
Solution manual Elementary Statistics Using the Graphing Calculator: For the TI-83/84 Plus (Mario Triola)
Solution manual Elementary Statistics Using the TI-83/84 Plus Calculator (2nd Ed., Mario Triola)
Solution manual Elementary Statistics Using the TI-83/84 Plus Calculator (3rd Ed., Mario Triola)
Solution manual Elementary Statistics Update (9th Ed., Mario Triola)
Solution manual Elementary Statistics (10th Ed., Mario Triola)
Solution manual Elementary Statistics (11th Ed., Mario Triola)
Solution manual Elementary Statistics - Technology Update (11th Ed., Mario Triola)
Solution manual Essentials of Statistics (2nd Ed., Mario Triola)
Solution manual Essentials of Statistics (3rd Ed., Mario Triola)
Solution manual Essentials of Statistics (4th Ed., Mario Triola)
Solution manual Introductory Statistics (7th Ed., Neil Weiss)
Solution manual Introductory Statistics (8th Ed., Neil Weiss)
Solution manual Introductory Statistics (9th Ed., Neil Weiss)
Solution manual Intro Stats (2nd Ed., De Veaux, Velleman & Bock)
Solution manual Intro Stats (3rd Ed., De Veaux, Velleman & Bock)
Solution manual Stats: Data and Models, (De Veaux, Velleman & Bock)
Solution manual Stats: Data and Models, (2nd Ed., De Veaux, Velleman & Bock)
Solution manual Elementary Statistics Using Excel (2nd Ed., Mario Triola)
Solution manual Elementary Statistics Using Excel (3rd Ed., Mario Triola)
Solution manual Elementary Statistics Using Excel (4th Ed., Mario Triola)
Solution manual Stats : Modeling the World (2nd Ed., Bock, Velleman & De Veaux)
Solution manual Stats : Modeling the World (3rd Ed., Bock, Velleman & De Veaux)
Solution manual Statistical Reasoning for Everyday Life (2nd Ed., Bennett, Briggs & Triola)
Solution manual Statistical Reasoning for Everyday Life (3rd Ed., Bennett, Briggs & Triola)
Solution manual Business Statistics (Triola & Franklin)
Solution manual Business Statistics (1st Ed., Sharpe, De Veaux & Velleman)
Solution manual Business Statistics (2nd Ed., Sharpe, De Veaux & Velleman)
Solution manual Business Statistics : A First Course (Sharpe, De Veaux & Velleman)
Solution manual Biostatistics for the Biological and Health Sciences with Statdisk (Marc Triola & Mario Triola)
Solution manual Biostatistics : A Guide to Design, Analysis and Discovery (2nd Ed., Ronald Forthofer, Eun Lee, Mike Hernandez)
Solution manual A Course in Probability (Neil A. Weiss)
Solution manual Probability and Statistics (3rd Ed., DeGroot & Schervish)
Solution manual Probability and Statistics (4th Ed., DeGroot & Schervish)
Solution manual Statistics for Science and Engineering (John Kinney)
Solution manual Mathematical Proofs : A Transition to Advanced Mathematics (1st Ed., Chartrand, Polimeni & Zhang)
Solution manual Mathematical Proofs : A Transition to Advanced Mathematics (2nd Ed., Chartrand, Polimeni & Zhang)

Solution manual Elementary Number Theory (5th Ed., Kenneth H. Rosen)
Solution manual History of Mathematics : Brief Version (Victor J. Katz)
Solution manual Geometry : An Investigative Approach (2nd Ed., Phares G. O'Daffer & Stanley Clemens)
Solution manual A First Course in Abstract Algebra (7th Ed., John Fraleigh)
Solution manual Complex Variables with Applications (3rd Ed., David Wunsch)
Solution manual Numerical Analysis with CD-ROM (Timothy Sauer)
Solution manual Numerical Analysis and Scientific Computation (Jeffery Leader)
Solution manual Linear Algebra and Differential Equations (Gary Peterson & James Sochacki)
Solution manual Elementary Differential Equations (2nd Ed., Werner Kohler & Lee Johnson)
Solution manual Elementary Differential Equations with Boundary Value Problems (2nd Ed., Werner Kohler & Lee Johnson)
Solution manual Fundamentals of Differential Equations (6th Ed., Kent B. Nagle, Late, Edward B. Saff & Arthur David Snider)
Solution manual Fundamentals of Differential Equations and Boundary Value Problems (4th Ed., Kent B. Nagle, Late, Edward B. Saff & Arthur David Snider)
Solution manual Linear Algebra and Its Applications with CD-ROM, Update (3rd Ed., David C. Lay)
Solution manual Introduction to Linear Algebra (5th ed., Lee W. Johnson, R. Dean Riess & Jimmy T. Arnold)
Solution manual Calculus for the Life Sciences (Marvin L. Bittinger, Neal Brand & John Quintanilla)
Solution manual Calculus with Applications for the Life Sciences (Raymond N. Greenwell, Nathan P. Ritchey & Margaret L. Lial)
Solution manual Calculus : An Integrated Approach to Functions and Their Rates of Change, Preliminary Edition (Robin J. Gottlieb)
Solution manual Calculus (9th Ed., George B. Thomas, Jr. & Ross L. Finney)
Solution manual Thomas' Calculus, Alternate Edition (9th Ed., George B. Thomas, Jr. & Ross L. Finney)
Solution manual Calculus : A Complete Course (2nd Ed., Ross L. Finney, Franklin D. Demana, Bert K. Waits & Daniel Kennedy)
Solution manual Calculus (Elgin H. Johnston & Jerry Mathews)
Solution manual Thomas' Calculus, Updated (10th Ed., George B. Thomas, Jr., Ross L. Finney, Maurice D. Weir & Frank R. Giordano)
Solution manual Thomas' Calculus (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual Thomas' Calculus Early Transcendentals (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual University Calculus (Joel D. Hass, Maurice D. Weir & George B. Thomas, Jr.)
Solution manual University Calculus : Alternate Edition (Joel D. Hass, Maurice D. Weir & George B. Thomas, Jr.)
Solution manual Thomas' Calculus, Media Upgrade (11th Ed., George B. Thomas, Jr., Maurice D. Weir & Frank R. Giordano)
Solution manual Thomas' Calculus, Early Transcendentals, Media Upgrade (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual Calculus with Applications (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Calculus with Applications, Brief Version (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Finite Mathematics with Applications (9th Ed., Margaret L. Lial, Thomas W.

Hungerford & John Holcomb)
Solution manual Finite Mathematics with Applications (10th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Finite Mathematics (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Mathematics with Applications (9th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Mathematics with Applications (10th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Mathematical Ideas (10th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas Expanded Edition (10th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas Expanded Edition (11th Ed., Miller, Heeren & Hornsby)
Solution manual Using and Understanding Mathematics: A Quantitative Reasoning Approach (3rd Ed., Bennett & Briggs)
Solution manual Using and Understanding Mathematics: A Quantitative Reasoning Approach (4th Ed., Bennett & Briggs)
Solution manual A Problem Solving Approach to Mathematics (9th Ed., Billstein, Libeskind & Lott)
Solution manual A Survey of Mathematics with Applications (7th Ed., Angel, Abbott & Runde)
Solution manual A Survey of Mathematics with Applications: Expanded Edition (7th Ed., Angel, Abbott & Runde)
Solution manual Mathematics All Around (3rd Ed., Tom Pirnot)
Solution manual Mathematics for Elementary School Teachers (3rd Ed., Phares O'Daffer, Randall Charles, Thomas Cooney, John Dossey & Jane Schielack)
Solution manual Mathematics for Elementary School Teachers (4th Ed., Phares O'Daffer, Randall Charles, Thomas Cooney, John Dossey & Jane Schielack)
Solution manual Mathematics for Elementary Teachers with Activities (Sybilla Beckmann)
Solution manual Mathematics for Elementary Teachers plus Activities Manual (2nd Ed., Sybilla Beckmann)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (8th Ed., Billstein, Libeskind & Lott)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (9th Ed., Billstein, Libeskind & Lott)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (10th Ed., Billstein, Libeskind & Lott)
Solution manual Essentials of Using and Understanding Mathematics : A Quantitative Reasoning Approach (Jeffrey Bennett & William Briggs)
Solution manual Technical Calculus with Analytic Geometry (4th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics (8th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics (9th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus (8th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus (9th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus Metric Version (8th Ed., Allyn Washington)
Solution manual Introduction to Technical Mathematics (5th Ed., Washington, Triola & Reda)
Solution manual A Graphical Approach to Precalculus (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits (3rd Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits : A Unit Circle Approach (4th Ed., Hornsby, Lial & Rockswold)

Solution manual A Graphical Approach to Precalculus with Limits : A Unit Circle Approach (5th Ed., Hornsby, Lial & Rockswold)
Solution manual Precalculus : Functions and Graphs (5th Ed., Demana, Waits, Foley & Kennedy)
Solution manual Precalculus : Graphical, Numerical, Algebraic (7th Ed., Demana, Waits, Foley & Kennedy)
Solution manual Precalculus : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Precalculus : Graphs and Models Graphing Calculator Manual Package (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Functioning in the Real World : A Precalculus Experience (2nd Ed., Gordon, F. Gordon, Tucker & Siegel)
Solution manual Precalculus with Modeling and Visualization (3rd Ed., Gary K. Rockswold)
Solution manual Precalculus with Modeling and Visualization (4th Ed., Gary K. Rockswold)
Solution manual Precalculus (2nd Ed., Beecher, Penna & Bittinger)
Solution manual Precalculus (3rd Ed., Beecher, Penna & Bittinger)
Solution manual Precalculus (3rd Ed., Mark Dugopolski)
Solution manual Precalculus (4th Ed., Mark Dugopolski)
Solution manual Precalculus : Functions and Graphs (2nd Ed., Mark Dugopolski)
Solution manual Precalculus : Functions and Graphs (3rd Ed., Mark Dugopolski)
Solution manual Fundamentals of Precalculus (Mark Dugopolski)
Solution manual Trigonometry (1st Ed., Mark Dugopolski)
Solution manual Trigonometry (2nd Ed., Mark Dugopolski)
Solution manual Trigonometry (3rd Ed., Mark Dugopolski)
Solution manual Trigonometry (8th Ed., Lial, Hornsby & Schneider)
Solution manual Trigonometry (9th Ed., Lial, Hornsby & Schneider)
Solution manual Trigonometry : A Circular Function Approach (Marie Aratari)
Solution manual A Graphical Approach to Algebra and Trigonometry (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Algebra and Trigonometry (5th Ed., Hornsby, Lial & Rockswold)
Solution manual Algebra and Trigonometry : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Algebra and Trigonometry (2nd Ed., Beecher, Penna & Bittinger)
Solution manual Algebra and Trigonometry (3rd Ed., Beecher, Penna & Bittinger)
Solution manual College Algebra and Trigonometry (1st Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra and Trigonometry (2nd Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra and Trigonometry (3rd Ed., Mark Dugopolski)
Solution manual College Algebra and Trigonometry (4th Ed., Mark Dugopolski)
Solution manual College Algebra and Trigonometry : A Unit Circle Approach (5th Ed., Mark Dugopolski)
Solution manual Algebra and Trigonometry with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual Algebra and Trigonometry with Modeling and Visualization (4th Ed., Gary Rockswold)
Solution manual College Algebra and Trigonometry (3rd Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra and Trigonometry (4th Ed., Lial, Hornsby & Schneider)
Solution manual A Graphical Approach to College Algebra (4th Ed., John Hornsby, Margaret

Lial & Gary Rockswold)
Solution manual A Graphical Approach to College Algebra (5th Ed., John Hornsby, Margaret Lial & Gary Rockswold)
Solution manual College Algebra : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual College Algebra (J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual College Algebra with Modeling and Visualization (4th Ed., Gary Rockswold)
Solution manual Essentials of College Algebra with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual Essentials of College Algebra (Lial, Hornsby & Schneider)
Solution manual Essentials of College Algebra, Alternate Edition (Lial, Hornsby & Schneider)
Solution manual Essentials of College Algebra (10th Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra (3rd Ed., Mark Dugopolski)
Solution manual College Algebra (4th Ed., Mark Dugopolski)
Solution manual College Algebra (5th Ed., Mark Dugopolski)
Solution manual College Algebra in Context with Applications for the Managerial, Life, and Social Sciences (1st Ed., Ronald Harshbarger & Lisa Yocco)
Solution manual College Algebra in Context with Applications for the Managerial, Life, and Social Sciences (2nd Ed., Ronald Harshbarger & Lisa Yocco)
Solution manual College Algebra (2nd Ed., Judith Beecher, Judith Penna & Marvin Bittinger)
Solution manual College Algebra (9th Ed., Margaret Lial, John Hornsby & David Schneider)
Solution manual Essentials of Geometry for College Students (2nd Ed., Margaret Lial, Barbara Brown, Arnold Steffenson & L. Murphy Johnson)
Solution manual Algebra for College Students (5th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (2nd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (3rd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (4th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning and Intermediate Algebra (3rd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning and Intermediate Algebra (4th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Elementary and Intermediate Algebra (1st Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Elementary and Intermediate Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Elementary and Intermediate Algebra (3rd Ed., Tom Carson, Bill Jordan)
Solution manual Introductory and Intermediate Algebra : A Combined Approach (2nd Ed., Marvin Bittinger & Judith Beecher)
Solution manual Introductory and Intermediate Algebra (3rd Ed., Marvin Bittinger & Judith Beecher)
Solution manual Introductory and Intermediate Algebra through Applications (2nd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Elementary and Intermediate Algebra (1st Ed., George Woodbury)
Solution manual Elementary and Intermediate Algebra (2nd Ed., George Woodbury)
Solution manual Elementary and Intermediate Algebra (2nd Ed., Mark Dugopolski)

Solution manual Elementary and Intermediate Algebra (3rd Ed., Mark Dugopolski)
Solution manual Elementary and Intermediate Algebra : Concepts and Applications (4th Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Beginning and Intermediate Algebra with Applications and Visualization (Gary Rockswold & Terry Krieger)
Solution manual Elementary and Intermediate Algebra : Graphs & Models (2nd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Foundations of Mathematics (Marvin Bittinger & Judith Penna)
Solution manual Intermediate Algebra (9th Ed., Marvin Bittinger)
Solution manual Intermediate Algebra (10th Ed., Marvin Bittinger)
Solution manual Intermediate Algebra : Graphs & Models (2nd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Intermediate Algebra : Graphs & Models (3rd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Intermediate Algebra (8th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Intermediate Algebra (9th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Intermediate Algebra with Applications and Visualization (2nd Ed., Gary Rockswold & Terry Krieger)
Solution manual Intermediate Algebra (Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Intermediate Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Intermediate Algebra (3rd Ed., Tom Carson, Bill Jordan)
Solution manual Intermediate Algebra: Concepts and Applications (7th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Beginning Algebra (10th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Prealgebra and Introductory Algebra (Marvin Bittinger & David Ellenbogen)
Solution manual Prealgebra and Introductory Algebra (2nd Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Introductory Algebra (9th Ed., Marvin Bittinger)
Solution manual Introductory Algebra (10th Ed., Marvin Bittinger)
Solution manual Prealgebra and Introductory Algebra (2nd Ed., Margaret Lial, John Hornsby, Terry McGinnis & Diana Hestwood)
Solution manual Prealgebra and Introductory Algebra (3rd Ed., Margaret Lial, Diana Hestwood, John Hornsby & Terry McGinnis)
Solution manual Elementary Algebra with Early Systems of Equations (Tom Carson & Ellyn Gillespie)
Solution manual Elementary Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Elementary Algebra (3rd Ed., Tom Carson, Bill Jordan)
Solution manual Elementary Algebra : Concepts and Applications (6th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Elementary Algebra : Concepts and Applications (7th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Introductory Algebra (Richelle Blair)
Solution manual Introductory Algebra (8th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory Algebra (9th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning Algebra with Applications and Visualization (Gary Rockswold & Terry Krieger)

Solution manual Integrated Arithmetic and Basic Algebra (3rd Ed., Bill Jordan & William Palow)
Solution manual Introductory Algebra through Applications (Geoffrey Akst & Sadie Bragg)
Solution manual Prealgebra (3rd Ed., Margaret Lial & Diana Hestwood)
Solution manual Prealgebra (4th Ed., Margaret Lial & Diana Hestwood)
Solution manual Prealgebra (4th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Prealgebra (5th Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Prealgebra (2nd Ed., Tom Carson)
Solution manual Basic Mathematics (9th Ed., Marvin Bittinger)
Solution manual Basic Mathematics (10th Ed., Marvin Bittinger)
Solution manual Basic Mathematics Preliminary Edition (Robert Prior)
Solution manual Basic Mathematics with Early Integers (Marvin Bittinger & Judith Penna)
Solution manual Basic College Mathematics (7th Ed., Margaret Lial, Stanley Salzman & Diana Hestwood)
Solution manual Basic College Mathematics (8th Ed., Margaret Lial, Stanley Salzman & Diana Hestwood)
Solution manual Basic Mathematics through Applications (3rd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Fundamental Mathematics through Applications (3rd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Wave Motion (J. Billingham & A. C. King)
Solution manual Solving ODEs with MATLAB (L. F. Shampine, I. Gladwell & S. Thompson)
Solution manual Numerical Solution of Partial Differential Equations: An Introduction (2nd Ed., K. W. Morton & D. F. Mayers)
Solution manual Measure Theory and Filtering : Introduction and Applications (Lakhdar Aggoun & Robert J. Elliott)
Solution manual Mathematical Models in Biology : An Introduction (Elizabeth S. Allman & John A. Rhodes)
Solution manual Insurance Risk and Ruin (David C. M. Dickson)
Solution manual Data Analysis and Graphics Using R : An Example-based Approach (2nd Ed., John Maindonald & John Braun)
Solution manual Applied Optimization with MATLAB Programming (1st Ed., P. Venkataraman)
Solution manual Applied Optimization with MATLAB Programming (2nd Ed., P. Venkataraman)
Solution manual Convex Optimization (Stephen Boyd & Lieven Vandenberghe)
Solution manual Concrete Abstract Algebra : From Numbers to Gröbner Bases (Niels Lauritzen)
Solution manual A Concrete Approach to Abstract Algebra : From the Integers to the Insolvability of the Quintic (Jeffrey Bergen)
Solution manual Calculus : Concepts and Methods (Ken Binmore & Joan Davies)
Solution manual An Introduction to Partial Differential Equations (Yehuda Pinchover & Jacob Rubinstein)
Solution manual An Introduction to Ordinary Differential Equations (James C. Robinson)
Solution manual An Introduction to Mathematical Physiology and Biology (2nd Ed., J. Mazumdar)
Solution manual An Introduction to Financial Option Valuation : Mathematics, Stochastics and Computation (Desmond Higham)
Solution manual An Interactive Introduction to Mathematical Analysis (Jonathan Lewin)
Solution manual An Introduction to Mathematical Finance: Options and Other Topics (1st Ed., Sheldon M. Ross)

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

I do not review the forums, just send me an email. Please do not use emails from servers "LIVE" , all they are take as spam emails in my inbox.

- Physics & Astronomy :

Solution manual Introduction to Solid State Physics (8th Ed., Charles Kittel)
Solution manual Quantum Physics (3rd Ed., Stephen Gasiorowicz)
Solution manual Fundamentals of Nuclear Reactor Physics (Elmer Lewis)
Solution manual Physics of Solar Energy (C. Julian Chen)
Solution manual Solar Engineering of Thermal Processes (3rd Ed., John Duffie & William Beckman)
Solution manual Physics of Condensed Matter (Prasanta Kumar Misra)
Solution Manual Human Body Dynamics (Aydin Tozeren)
Solution manual Solid-State Physics : Introduction to the Theory (2nd Ed., James Patterson, Bernard Bailey)
Solution manual Introduction to Nuclear Engineering (3rd Ed., John R. Lamarsh & Anthony J. Baratta)
Solution manual Nuclear Energy : An Introduction to the Concepts, Systems, and Applications of Nuclear Processes (6th Ed., Raymond L. Murray)
Solution manual Fundamentals of Electromagnetics with Engineering Applications (Stuart M. Wentworth)
Solution manual Physics (7th Ed. by Paul E. Tippens)
Solution manual Physics (6th Ed., Cutnell & Johnson)
Solution manual Physics (7th Ed., Cutnell & Johnson)
Solution manual Physics (8th Ed., Cutnell & Johnson)
Solution manual Physics (9th Ed., Cutnell & Johnson)
Solution manual Essentials of Physics (Cutnell & Johnson)
Solution manual Understanding Physics (1st Ed., Cummings, Laws, Redish & Cooney)
Solution manual Introductory Physics : Building Understanding (Jerold Touger)
Solution manual Physics Matters : An Introduction to Conceptual Physics (James Trefil & Robert Hazen)
Solution manual How Things Work : The Physics of Everyday Life (3rd Ed., Louis Bloomfield)

Solution manual An Introduction to Modern Astrophysics (2nd Ed., Bradley W. Carroll & Dale A. Ostlie)
Solution manual Foundations of Astrophysics (Barbara Ryden & Bradley Peterson)
Solution manual Modern Physics (3rd Ed., Kenneth S. Krane)
Solution manual Physics (5th Ed., Halliday, Resnick, Krane)
Solution manual Fundamentals of Physics (6th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (7th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (8th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (9th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (3rd Ed., Thomas Griffith)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (4th Ed., Thomas Griffith)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (5th Ed., Thomas Griffith)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (6th Ed., W. Thomas Griffith & Juliet W. Brosing)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (7th Ed., W. Thomas Griffith & Juliet W. Brosing)
Solution manual Integrated Science (2nd Ed., Tillery et al.)
Solution manual Integrated Science (3rd Ed., Tillery et al.)
Solution manual Integrated Science (4th Ed., Tillery et al.)
Solution manual Physical Science (5th Ed., Tillery)
Solution manual Physical Science (6th Ed., Tillery)
Solution manual Physical Science (7th Ed., Tillery)
Solution manual Physical Science (8th Ed., Tillery)
Solution manual The Physical Universe (11th Ed., Konrad Krauskopf & Arthur Beiser)
Solution manual The Physical Universe (12th Ed., Konrad Krauskopf & Arthur Beiser)
Solution manual Physics of the Life Sciences (Jay Newman)
Solution manual Introduction to Biomedical Engineering (2nd Ed., John Enderle, Susan Blanchard, Joseph Bronzino)
Solution manual Introduction to Biomedical Engineering (3rd Ed., John Enderle, Joseph Bronzino)
Solution manual Physics in Biology and Medicine (3rd Ed., Paul Davidovits)
Solution manual Optics (1st Ed., Ajoy Ghatak)
Solution manual Optics (4th Ed., Eugene Hecht)
Solution manual Nonlinear Optics (3rd Ed., Robert Boyd)
Solution manual Introduction to Optics (3rd Ed., Frank L Pedrotti, Leno M Pedrotti & Leno S Pedrotti)
Solution manual Principles of Physical Optics (Charles Bennett)
Solution manual Optics : Principles and Applications (Kailash Sharma)
Solution manual Continuum Electromechanics (James R. Melcher)
Solution manual Electromagnetic Noise and Quantum Optical Measurements (Hermann A. Haus)
Solution Manual Fuel Cell Engines (Matthew M. Mench)
Solution Manual Fuel Cell Fundamentals (1st Ed., Ryan O'Hayre, et. al)
Solution Manual Fuel Cell Fundamentals (2nd Ed., Ryan O'Hayre, Whitney Colella, Suk-Won

Cha, Fritz Prinz)
Solution manual Matter and Interactions I : Modern Mechanics (2nd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions : Volume 1 : Modern Mechanics (3rd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions II : Electric and Magnetic Interactions (2nd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions : Volume 2 : Electric and Magnetic Interactions (3rd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Thermal Stresses (2nd Ed., Noda, Hetnarski & Tanigawa)
Solution manual Introduction to Statistical Physics (Kerson Huang)
Solution manual Extended Irreversible Thermodynamics (3rd Ed., D. Jou, J. Casas-Vazquez & G. Lebon)
Solution manual An Introduction to Thermodynamics and Statistical Mechanics (2nd Ed, Keith Stowe)
Solution manual Equilibrium and Non-Equilibrium Statistical Thermodynamics (Michel Le Bellac, Fabrice Mortessagne & G. George Batrouni)
Solution manual Elements of Statistical Mechanics: With an Introduction to Quantum Field Theory and Numerical Simulation (Ivo Sachs & Siddhartha Sen)
Solution manual Quantum Transport (2nd Ed., Supriyo Datta)
Solution manual Ocean Waves and Oscillating Systems (Johannes Falnes)
Solution manual Statistical Mechanics (2nd Ed., R.K. Pathria)
Solution manual Statistical Mechanics (3rd Ed., R.K. Pathria , Paul D. Beale)
Solution manual Quantum Mechanics : From Basic Principles to Numerical Methods and Applications (Louis Marchildon)
Solution manual Quantum Mechanics (Gennaro Auletta, Mauro Fortunato & Giorgio Parisi)
Solution manual Fundamentals of Quantum Mechanics (C.L. Tang)
Solution manual Astronomy : A Physical Perspective (2nd Ed., Marc L. Kutner)
Solution manual Classical Mechanics (Douglas Gregory)
Solution manual Electromagnetic Field Theory Fundamentals (2nd Ed., Singh Guru & Hiziroglu)
Solution manual Special Relativity : From Einstein to Strings (P.M. Schwarz & J.H. Schwarz)
Solution manual Gravity : An Introduction to Einstein's General Relativity (James Hartle)
Solution manual A Short Course in General Relativity (3rd Ed., James Foster & J. David Nightingale)
Solution manual Statistical Thermodynamics (Normand Laurendeau)
Solution Manual Introductory Statistical Thermodynamics (Nils Dalarsson , Mariana Dalarsson & Leonardo Golubovic)
Solution manual Statistical Thermodynamics and Microscale Thermophysics (Van P. Carey)
Solution manual Thermal Physics (Ralph Baierlein)
Solution manual Topics in Atomic Physics (Charles E. Burkhardt, Jacob J. Leventhal)
Solution manual Foundations of Quantum Physics (Charles E. Burkhardt, Jacob J. Leventhal)
Solution manual Essential University Physics (2nd Ed., Richard Wolfson)
Solution manual Essential College Physics (Andrew Rex, Richard Wolfson)
Solution manual Applied Physics (8th Ed., Dale Ewen, Ronald Nelson, Neill Schurter & Erik Gundersen)
Solution manual Applied Physics (9th Ed., Dale Ewen, Neill Schurter & Erik Gundersen)
Solution manual Analytical Mechanics (7th Ed., Grant R. Fowles, George Cassiday)
Solution manual Orbital Mechanics for Engineering Students (1st Ed., Howard Curtis)
Solution manual Orbital Mechanics for Engineering Students (2nd Ed., Howard Curtis)
Solution manual Diagnostic Ultrasound Imaging : Inside Out (Thomas Szabo)

Solution manual Astronomy : A Beginner's Guide to the Universe (5th Ed., Eric Chaisson & Steve McMillan)
Solution manual The Cosmic Perspective (5th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Cosmic Perspective Media Update (4th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective Media Update (4th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective Media Update (3rd Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective (3rd Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual Astronomy Today (5th Ed., Eric Chaisson & Steve McMillan)
Solution manual Astronomy Today (6th Ed., Eric Chaisson & Steve McMillan)
Solution manual Conceptual Physical Science (3rd Ed., Paul G. Hewitt, John A. Suchocki & Leslie Hewitt)
Solution manual Conceptual Physical Science (4th Ed., Paul G. Hewitt, John A. Suchocki & Leslie Hewitt)
Solution manual Conceptual Integrated Science (Paul G. Hewitt, Suzanne Lyons, John A. Suchocki & Jennifer Yeh)
Solution manual Physics : Concepts & Connections (4th Ed., Art Hobson)
Solution manual Physics : Concepts & Connections (5th Ed., Art Hobson)
Solution manual Conceptual Physics (10th Ed., Paul Hewitt)
Solution manual Conceptual Physics (11th Ed., Paul Hewitt)
Solution manual Conceptual Physics Fundamentals (Paul G. Hewitt)
Solution manual College Physics : A Strategic Approach (2nd Ed., Randall D. Knight, Brian Jones, Stuart Field)
Solution manual College Physics (6th Ed., Jerry Wilson, Anthony Buffa & Bo Lou)
Solution manual College Physics (7th Ed., Jerry Wilson, Anthony Buffa & Bo Lou)
Solution manual College Physics (8th Ed., Young & Geller)
Solution manual Modern Physics (2nd Ed., Randy Harris)
Solution manual Modern Physics for Scientists and Engineers (John Morrison)
Solution manual Solid State Physics : Essential Concepts (David Snoke)
Solution manual Physics with Mastering Physics (3rd Ed., James Walker)
Solution manual Physics with Mastering Physics (4th Ed., James Walker)
Solution manual Active Learning Guide (Alan Van Heuvelen & Eugenia Etkina)
Solution manual E&M TIPERs : Electricity & Magnetism Tasks (C. J. Hieggelke, D. P. Maloney, T. L. O'Kuma & Steve Kanim)
Solution manual Physics : Principles with Applications (6th Ed., Douglas C. Giancoli)
Solution manual Physlet® Physics : Interactive Illustrations, Explorations and Problems for Introductory Physics (Wolfgang Christian & Mario Belloni)
Solution manual University Physics with Modern Physics with Mastering Physics (11th Ed., Hugh Young & Roger Freedman)
Solution manual University Physics with Modern Physics with Mastering Physics (12th Ed., Hugh Young & Roger Freedman)
Solution manual Physics for Scientists and Engineers (3rd Ed., Douglas C. Giancoli)
Solution manual Physics for Scientists and Engineers with Modern Physics (3rd Ed., Douglas Giancoli)
Solution manual Physics for Scientists and Engineers with Modern Physics (4th Ed., Douglas Giancoli)

Solution manual Physlet® Quantum Physics : An Interactive Introduction (Mario Belloni, Wolfgang Christian & Anne Cox)
Solution manual Introduction to Electrodynamics (3rd Ed., David J. Griffiths)
Solution manual Introduction to Quantum Mechanics (2nd Ed., David Griffiths)
Solution manual Quantum Mechanics : An Accessible Introduction (Robert Scherrer)
Solution manual Modern Quantum Mechanics (J. J. Sakurai)
Solution manual Modern Quantum Mechanics (2nd Ed., J. J. Sakurai & Jim Napolitano)
Solution manual The Physics of Sound (3rd Ed., Richard Berg & David Stork)
Solution manual Electromagnetism : Principles and Applications (1st Ed., Paul Lorrain, Dale R. Corson)
Solution manual Classical Electromagnetism (Jerrold Franklin)
Solution manual Classical Electrodynamics (2nd Ed., John David Jackson)
Solution manual Nanoengineering of Structural, Functional and Smart Materials (Mark Schulz, Ajit Kelkar, Mannur Sundaresan)
Solution manual Introduction to Color Imaging Science (Hsien-Che Lee)
Solution manual An Introduction to Astrobiology (Iain Gilmour & Mark Sephton)
Solution manual An Introduction to Galaxies and Cosmology (Mark HJones & Robert Lambourne)
Solution manual An Introduction to the Solar System (Neil McBride & Iain Gilmour)
Solution manual Quantum Physics (Michel Le Bellac)
Solution manual Laser Fundamentals (2nd Ed., William T. Silfvast)
Solution manual Laser Electronics (3rd Ed., Joseph T. Verdeyen)
Solution manual Introductory Quantum Optics (Christopher Gerry & Peter Knight)
Solution manual Introduction to Plasma Physics: With Space and Laboratory Applications (D. A. Gurnett & A. Bhattacharjee)
Solution manual A Short Introduction to Quantum Information and Quantum Computation (Michel Le Bellac)
Solution manual A Quantum Approach to Condensed Matter Physics (Philip L. Taylor & Olle Heinonen)
Solution manual A First Course in String Theory (Barton Zwiebach)
Solution manual A First Course in Computational Physics and Object-Oriented Programming with C++ (David Yevick)
Solution manual A Course in Modern Mathematical Physics : Groups, Hilbert Space and Differential Geometry (Peter Szekeres)
Solution manual Ultrasonic Nondestructive Evaluation Systems: Models and Measurements (Lester W. Schmerr & Sung-Jin Song)
Solution manual Explorations : Stars Galaxies and Planets (1st Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (2nd Ed., Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (3rd Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (4th Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (5th Ed. Updated, Thomas Arny)
Solution manual Astronomy : Journey to the Cosmic Frontier (3rd Ed., John D. Fix)
Solution manual Astronomy : Journey to the Cosmic Frontier (4th Ed., John D. Fix)
Solution manual Astronomy : Journey to the Cosmic Frontier (5th Ed., John D. Fix)
Solution manual Pathways to Astronomy with Starry Night Pro (Steven Schneider & Thomas T Arny)
Solution manual From Molecules to Networks (2nd Ed., John Byrne & James Roberts)
Solution manual Biotechnology (David Clark & Nanette Pazdernik)
Solution manual Light and Video Microscopy (Randy Wayne)
Solution manual Mathematical Methods for Physicists : A Comprehensive Guide (7th Ed., George Arfken, Hans Weber & Frank Harris)

- Civil Engineering and Architecture :

Solution manual Mechanical and Structural Vibrations : Theory and Applications (Jerry H. Ginsberg)
Solution manual Structural Analysis (4th Ed., Aslam Kassimali)
Solution manual Fundamentals of Structural Analysis (1st Ed., Leet & Uang)
Solution manual Fundamentals of Structural Analysis (2nd Ed., Leet & Uang)
Solution manual Fundamentals of Structural Analysis (3rd Ed., Leet, Uang & Gilbert)
Solution manual Fundamentals of Structural Analysis (4th Ed., Leet, Uang & Gilbert)
Solution manual A Structures Primer (Harry F. Kaufman)
Solution manual Steel Design (4th Ed., William T. Segui)
Solution manual Advanced Methods of Structural Analysis (Igor A. Karnovsky & Olga Lebed)
Solution manual Matrix Structural Analysis, With MASTAN2 (2nd Ed., William McGuire, Richard H. Gallagher, Ronald D. Ziemian)
Solution manual Structural and Stress Analysis (2nd Ed., Megson)
Solution manual Structural Steel Design ASD Method (4th Ed., Jack McCormac)
Solution manual Structural Steel Design (4th Ed., Jack McCormac)
Solution manual Structural Steel Design (5th Ed., Jack C. McCormac & Stephen F. Csernak)
Solution manual Structural Steel Design : A Practice Oriented Approach (Abi Aghayere & Jason Vigil)
Solution manual Unified Design of Steel Structures (1st Ed., Louis Geschwindner)
Solution manual Unified Design of Steel Structures (2nd Ed., Louis Geschwindner)
Solution manual Steel Structures : Behavior and LRFD (1st Ed., Ramulu Vinnakota)
Solution manual The Engineering of Foundations (1st Ed., Rodrigo Salgado)
Solution manual Construction Project Scheduling and Control (2nd Ed., Saleh A. Mubarak)
Solution manual Introduction to Infrastructure : An Introduction to Civil and Environmental Engineering (Michael R. Penn, Philip J. Parker)
Solution manual Civil and Environmental Systems Engineering (2nd Ed., Charles S. Revelle,

Earl Whitlatch, Jeff Wright)
Solution manual Mechanics of Materials : A Modern Integration of Mechanics and Materials in Structural Design (Christopher Jenkins & Sanjeev Khanna)
Solution manual Analysis and Design of Shallow and Deep Foundations (Lymon Reese, William Isenhower & Shin-Tower Wang)
Solution manual Elementary Structures for Architects and Builders (5th Ed., Ronald Shaeffer)
Solution manual Building Structures (3rd Ed., James Ambrose & Patrick Tripeny)
Solution manual Statics and Strength of Materials for Architecture and Building Construction (3rd Ed., Onouye & Kane)
Solution manual Statics and Strength of Materials for Architecture and Building Construction (4th Ed., Onouye & Kane)
Solution manual Finite Element Techniques in Structural Mechanics (C. T. F. Ross)
Solution manual Fundamental Finite Element Analysis and Applications: with Mathematica and Matlab Computations (Asghar Bhatti)
Solution manual Advanced Topics in Finite Element Analysis of Structures : With Mathematica and MATLAB Computations (Asghar Bhatti)
Solution manual Adjustment Computations : Spatial Data Analysis (4th Ed., Charles Ghilani & Paul Wolf)
Solution manual Adjustment Computations : Spatial Data Analysis (5th Ed., Charles Ghilani)
Solution manual Surveying (5th Ed., Jack McCormac)
Solution manual Surveying (6th Ed., Jack McCormac, Wayne Sarasua, William Davis)
Solution manual Surveying with Construction Applications (6th Ed., Barry Kavanagh)
Solution manual Surveying with Construction Applications (7th Ed., Barry Kavanagh)
Solution manual Surveying : Principles and Applications (8th Ed., Barry Kavanagh)
Solution manual Surveying Fundamentals and Practices (5th Ed., Jerry Nathanson, Michael Lanzafama & Philip Kissam)
Solution manual Surveying Fundamentals and Practices (6th Ed., Jerry Nathanson, Michael Lanzafama & Philip Kissam)
Solution manual Structural Analysis (5th Ed., Hibbeler)
Solution manual Structural Analysis (7th Ed., Hibbeler)
Solution manual Structural Analysis - SI Units (7th Ed., Hibbeler)
Solution manual Structural Analysis (8th Ed., Hibbeler)
Solution manual Dynamics of Structures (3rd Ed., Chopra)
Solution manual Dynamics of Structures (4th Ed., Chopra)
Solution manual Designing with Geosynthetics (5th Ed., Robert M. Koerner)
Solution manual Geotechnical Earthquake Engineering (Steven L. Kramer)
Solution manual Principles of Geotechnical Engineering (6th Ed., Braja M. Das)
Solution manual An Introduction to Geotechnical Engineering (2nd Ed., Robert D. Holtz, William D. Kovacs, Thomas C. Sheahan)
Solution manual Foundation Design : Principles and Practices (2nd Ed., Donald P. Coduto)
Solution manual Geotechnical Engineering: Principles and Practices (2nd Ed., Donald P. Coduto, Man-chu Ronald Yeung & William A. Kitch)
Solution manual Geotechnical Engineering: Principles and Practices - International Version (2nd Ed., Donald P. Coduto, Man-chu Ronald Yeung & William A. Kitch)
Solution manual Fundamentals of Structural Stability (George Simitses & Dewey Hodges)
Solution manual Fundamentals of Structural Mechanics (2nd Ed., keith D. Hjelmstad)
Solution Manual Structural Dynamics : Theory and Applications (Tedesco, McDougal & Ross)
Solution manual Fundamentals of Structural Dynamics (2nd Ed., Roy Craig & Andrew Kurdila)
Solution manual Concrete (2nd Ed., Sidney Mindess, J. Francis Young, David Darwin)
Solution manual Design of Concrete Structures (13th Ed., Nilson, Darwin & Dolan)

Solution manual Design of Concrete Structures (14th Ed., Nilson, Darwin & Dolan)
Solution manual Structures (6th Ed., Daniel Lewis Schodek & Martin Bechthold)
Solution manual Concrete Structures (Mehdi Setareh & Robert Darvas)
Solution manual Reinforced Concrete Design : A Practical Approach (Brzev & Pao)
Solution manual Reinforced Concrete : A Fundamental Approach (6th Ed., Edward Nawy)
Solution manual Prestressed Concrete : A Fundamental Approach - ACI, AASHTO, IBC 2009 Codes Version (5th Ed. Update, Edward Nawy)
Solution manual Reinforced Concrete Design (6th Ed., Chu-Kia Wang, Charles Salmon)
Solution manual Reinforced Concrete Design (7th Ed., Chu-Kia Wang, Charles Salmon & José Pincheira)
Solution manual Reinforced Concrete Design (6th Ed., George Limbrunner & Abi Aghayere)
Solution manual Reinforced Concrete Design (7th Ed., George Limbrunner & Abi Aghayere)
Solution manual Reinforced Concrete : Mechanics and Design (4th Ed., James MacGregor & James Wight)
Solution manual Reinforced Concrete : Mechanics and Design (5th Ed., James Wight & James MacGregor)
Solution manual Reinforced Concrete : Mechanics and Design - International Version (5th Ed., James Wight & James MacGregor)
Solution manual Reinforced Concrete : Mechanics and Design (6th Ed., James Wight & James MacGregor)
Solution manual Structural Concrete : Theory and Design (3rd Ed., M. Nadim Hassoun & Akthem Al-Manaseer)
Solution manual Structural Concrete : Theory and Design (4th Ed., M. Nadim Hassoun & Akthem Al-Manaseer)
Solution manual Design of Reinforced Concrete (6th Ed., Jack McCormac & James Nelson)
Solution manual Design of Reinforced Concrete (7th Ed., ACI 318-05 Code Edition, by Jack McCormac)
Solution manual Design of Reinforced Concrete (8th Ed., Jack McCormac & Russell Brown)
Solution manual Structural Analysis : Using Classical and Matrix Methods (3rd Ed., James Nelson, Jr., Jack McCormac)
Solution manual Structural Analysis : Using Classical and Matrix Methods (4th Ed., Jack McCormac)
Solution manual Pavement Design and Materials (A. T. Papagiannakis, E. A. Masad)
Solution manual Pavement Analysis and Design (2nd Ed., Yang H. Huang)
Solution manual Traffic Engineering (4th Ed., Roger P. Roess, Elena S. Prassas, William R. McShane)
Solution manual Traffic and Highway Engineering (3rd Ed., Nicholas Garber & Lester Hoel)
Solution manual Principles of Highway Engineering and Traffic Analysis (3rd Ed., Fred Mannering, Walter Kilareski & Scott Washburn)
Solution manual Principles of Highway Engineering and Traffic Analysis (4th Ed., Fred Mannering, Walter Kilareski & Scott Washburn)
Solution manual Highway Engineering (7th Ed., Paul Wright & Karen Dixon)
Solution manual Soil Mechanics : Concepts and Applications (2nd Ed., William Powrie)
Solution manual Unsaturated Soil Mechanics (Ning Lu & William Likos)
Solution manual Soil Mechanics and Foundations (2nd Ed., Muni Budhu)
Solution manual Soil Mechanics and Foundations (3rd Ed., Muni Budhu)
Solution manual Soils and Foundations - SI Units (6th Ed., Liu & Evett)
Solution manual Soils and Foundations (7th Ed., Liu & Evett)
Solution manual Fundamentals of Soil Mechanics for Sedimentary and Residual Soils (Laurence Wesley)

Solution manual Essentials of Soil Mechanics and Foundations : Basic Geotechnics (7th Ed., David McCarthy)
Solution manual Foundations and Earth Retaining Structures (Muniram Budhu)
Solution manual Design Analysis in Rock Mechanics (William G. Pariseau)
Solution manual Probability Concepts in Engineering : Emphasis on Applications to Civil and Environmental Engineering (2nd Ed., Ang & Tang)
Solution manual Hydraulic Control Systems (Noah Manring)
Solution manual Open Channel Hydraulics (A. Osman Akan)
Solution manual Open Channel Hydraulics (1st Ed., Terry Sturm)
Solution manual Open Channel Hydraulics (2nd Ed., Terry Sturm)
Solution manual Open-Channel Flow (2nd Ed., M. Hanif Chaudhry)
Solution manual Frozen Ground Engineering (2nd Ed., Orlando Andersland & Branko Ladanyi)
Solution manual Hydraulics in Civil and Environmental Engineering (4th Ed. Andrew Chadwick)
Solution manual Fundamentals of Hydraulic Engineering Systems (4th Ed., Robert Houghtalen, A. Osman Akan, Ned H. C. Hwang)
Solution manual Transportation Engineering : An Introduction (3rd Ed., C. Jotin Khisty, B. Kent Lall)
Solution manual Introduction to Transportation Engineering (2nd Ed., Banks)
Solution manual Urban Transportation Planning (2nd Ed., Meyer & Miller)
Solution manual Transportation Engineering and Planning (3rd Ed., Papacostas & Prevedouros)
Solution manual Transportation Engineering and Planning - SI Edition (3rd Ed., Papacostas & Prevedouros)
Solution manual Structural Wood Design : A Practice-Oriented Approach (Abi Aghayere & Jason Vigil)
Solution manual Simplified Design of Wood Structures (6th Ed., James Ambrose & Patrick Tripeny)
Solution manual Simplified Design of Steel Structures (8th Ed., James Ambrose & Patrick Tripeny)
Solution manual Simplified Engineering for Architects and Builders (11th Ed., James Ambrose & Patrick Tripeny)
Solution manual Materials and Components of Interior Architecture (7th Ed., J. Rosemary Riggs)
Solution manual Olin's Construction : Principles, Materials, and Methods (8th Ed., H. Leslie Simmons)
Solution manual Basic Construction Materials (8th Ed., Theodore Marotta, John C. Coffey, Cynthia LaFleur-Brown & Christine LaPlante)
Solution manual Fundamentals of Residential Construction (2nd Ed., Edward Allen & Rob Thallon)
Solution manual Fundamentals of Building Construction : Materials and Methods (4th Ed., Edward Allen & Joseph Iano)
Solution manual Fundamentals of Building Construction : Materials and Methods (5th Ed., Edward Allen & Joseph Iano)
Solution manual Composites for Construction : Structural Design with FRP Materials (Lawrence Bank)
Solution manual Building Construction : Principles, Materials, and Systems (Madan Mehta, Diane Armpriest & Walter Scarborough)
Solution manual Construction Contracts (2nd Ed., Jimmie Hinze)
Solution manual Construction Contracts (3rd Ed., Jimmie Hinze)

Solution manual Construction Planning and Scheduling (3rd Ed., Jimmie W. Hinze)
Solution manual Construction Planning and Scheduling (4th Ed., Jimmie W. Hinze)
Solution manual Sustainable Construction and Design (Regina Leffers)
Solution manual Global Engineering and Construction (J. K. Yates)
Solution manual Construction Mathematics (Virdi & Baker)
Solution manual Materials for Civil and Construction Engineers (3rd Ed., Michael S. Mamlouk & John P. Zaniewski)
Solution manual Construction Management (3rd Ed., Daniel Halpin)
Solution manual Construction Management (4th Ed., Daniel Halpin & Bolivar Senior)
Solution manual Financial Management and Accounting Fundamentals for Construction (Daniel Halpin & Bolivar Senior)
Solution manual Construction Management Fundamentals (1st Ed., Schexnayder & Mayo)
Solution manual Construction Management Fundamentals (2nd Ed., Knutson, Schexnayder, Fiori & Mayo)
Solution manual Construction Planning, Equipment, and Methods (6th Ed., Peurifoy & Schexnayder)
Solution manual Construction Planning, Equipment, and Methods (7th Ed., Peurifoy, Schexnayder & Shapira)
Solution manual Construction Planning, Equipment, and Methods (8th Ed., Peurifoy, Schexnayder, Shapira & Schmitt)
Solution manual Construction Methods and Management (7th Ed., Stephens Nunnally)
Solution manual Construction Methods and Management (8th Ed., Stephens Nunnally)
Solution manual Construction Project Administration (8th Ed., Edward Fisk, Wayne Reynolds)
Solution manual Construction Project Administration (9th Ed., Edward Fisk, Wayne Reynolds)
Solution manual Construction Project Management (3rd Ed., Gould & Joyce)
Solution manual The Management of Construction : A Project Lifecycle Approach (F. Lawrence Bennett)
Solution manual Construction Accounting and Financial Management (1st Ed., Steven Peterson)
Solution manual Construction Accounting and Financial Management (2nd Ed., Steven Peterson)
Solution manual Principles and Practices of Commercial Construction (8th Ed., Cameron K. Andres & R.C. Smith)
Solution manual Construction Cost Analysis and Estimating (Phillip Ostwald)
Solution manual Cost Analysis and Estimating for Engineering and Management (Phillip Ostwald & Timothy McLaren)
Solution manual Construction Estimating Using Excel (Stephen J. Peterson)
Solution manual Heating, Ventilation, and Air Conditioning in Buildings (1st Ed., John W. Mitchell, James E. Braun)
Solution manual Heating and Cooling of Buildings : Design for Efficiency (2nd Ed., Jan Kreider, Peter Curtiss & Ari Rabl)
Solution manual Heating, Cooling, Lighting : Sustainable Design Methods for Architects (3rd Ed., Norbert Lechner)
Solution manual Mechanical and Electrical Systems in Architecture, Engineering and Construction (5th Ed., Frank R. Dagostino & Joseph B. Wujek)
Solution manual Mechanical and Electrical Equipment for Buildings (10th Ed., Stein, Reynolds, Grondzik, Kwok)
Solution manual Mechanical and Electrical Equipment for Buildings (11th Ed., Grondzik, Kwok, Stein & Reynolds)
Solution manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis &

William Tao)
Solution manual Introduction to Naval Architecture : Formerly Muckle's Naval Architecture for Marine Engineers (4th Ed., E.C. Tupper)
Solution manual Architectural Drawing and Light Construction (8th Ed., Philip A. Grau, III & Edward J. Muller)
Solution manual NEW Autodesk Civil 3D : Procedures & Applications (Harry O. Ward)
Solution manual Structural Health Monitoring with Piezoelectric Wafer Active Sensors (Victor Giurgiutiu)
Solution manual Architecture Design Notebook (2nd Ed., Peter Fawcett)
Solution manual Civil Drafting Technology (7th Ed., David A. Madsen, Terence M. Shumaker & David P. Madsen)
Solution manual Introduction to Homeland Security (2nd Ed., Bullock & George Haddow)

- Environmental Engineering, Earth and Environmental Sciences :

Solution manual Principles of Environmental Engineering and Science (1st Ed., Mackenzie Davis & Susan Masten)
Solution manual Principles of Environmental Engineering and Science (2nd Ed., Mackenzie Davis & Susan Masten)
Solution manual Introduction to Environmental Engineering (Richard Mines & Laura Lackey)
Solution manual Introduction to Environmental Engineering (4th Ed., MacKenzie Davis & David Cornwell)
Solution manual Introduction to Environmental Engineering (5th Ed., MacKenzie Davis & David Cornwell)
Solution manual Introduction to Environmental Engineering and Science (2nd Ed., Gilbert Masters)
Solution manual Introduction to Environmental Engineering and Science (3rd Ed., Gilbert Masters & Wendell Ela)
Solution manual Thermal Environmental Engineering (3rd Ed., Thomas H. Kuehn, James W. Ramsey, James L. Threlkeld)
Solution manual Solar Energy Engineering (Soteris Kalogirou)
Solution manual Environmental Science and Engineering (2nd Ed., J. Glynn Henry, Gary W. Heinke)
Solution manual Solar Engineering of Thermal Processes (2nd Ed., John Duffie & William Beckman)
Solution manual Solar Engineering of Thermal Processes (3rd Ed., John Duffie & William Beckman)
Solution manual Energy Technology and Directions for the Future (Fanchi)
Solution manual Civil and Environmental Systems Engineering (2nd Ed., Charles S. Revelle, Earl Whitlatch, Jeff Wright)
Solution manual Environmental Engineering : Fundamentals, Sustainability, Design (James

Mihelcic, Julie Zimmerman)
Solution manual Environmental Engineering Science (Nazaroff & Alvarez - Cohen)
Solution manual Environmental Engineering (4th Ed., Ruth Weiner & Robin Matthews)
Solution manual Environmental Pollution and Control (4th Ed., Peirce, Vesilind & Weiner)
Solution manual Introduction to Engineering and the Environment (1st Ed., Edward Rubin)
Solution manual Basic Environmental Technology : Water Supply, Waste Management & Pollution Control (5th Ed., Jerry Nathanson)
Solution manual Water and Wastewater Technology - SI Units (5th Ed., Mark J. Hammer, Sr. & Mark Hammer, Jr.)
Solution manual Water and Wastewater Technology (6th Ed., Mark J. Hammer, Sr. & Mark Hammer, Jr.)
Solution manual Water and Wastewater Technology (7th Ed., Mark J. Hammer, Sr. & Mark Hammer, Jr.)
Solution manual Water and Wastewater Engineering (Mackenzie L. Davis)
Solution manual Water and Wastewater Engineering : Water Supply and Wastewater Removal (3rd Ed., Nazih K. Shammas & Lawrence K. Wang)
Solution manual Water Supply and Pollution Control (8th Ed., Viessman Jr., Hammer, Perez & Chadik)
Solution manual Water Supply and Pollution Control - International Version (8th Ed., Viessman Jr., Hammer, Perez & Chadik)
Solution manual Water Treatment : Principles and Design (2nd Ed., by MWH)
Solution manual Water Resources Engineering (Ralph A. Wurbs & Wesley P. James)
Solution manual Ground and Surface Water Hydrology (Larry W. Mays)
Solution manual Water Resources Engineering 2005 Edition (Larry W. Mays)
Solution manual Water Resources Engineering (2nd Ed., Larry W. Mays)
Solution manual Water Resources Engineering (2nd Ed., Chin)
Solution manual Water Chemistry (Benjamin)
Solution manual Aquatic Pollution : An Introductory Text (3rd Ed., Edward A. Laws)
Solution manual Plant Pathology (5th Ed., George Agrios)
Solution manual Radiation Detection and Measurement (3rd Ed., Glenn Knoll)
Solution manual Radiation Detection and Measurement (4th Ed., Glenn Knoll)
Solution manual Principles of Sequence Stratigraphy (Octavian Catuneanu)
Solution manual The Earth's Ionosphere : Plasma Physics & Electrodynamics (2nd Ed., Michael Kelley)
Solution manual Atmosphere, Ocean and Climate Dynamics : An Introductory Text (Marshall & Plumb)
Solution manual Atmospheric Science : An Introductory Survey (2nd Ed., John Wallace, Peter Hobbs)
Solution manual Environmental Issues : An Introduction to Sustainability (3rd Ed., McConnell & Abel)
Solution manual Environmental Science : Toward A Sustainable Future (10th Ed., Wright & Nebel)
Solution manual Hazard City : Assignments in Applied Geology (3rd Ed., King, Carpenter & Wilson)
Solution manual Introduction to Environmental Geology (4th ERd., Edward Keller)
Solution manual The Science of Grapevines : Anatomy and Physiology (Markus Keller)
Solution manual Geoenvironmental Engineering : Site Remediation, Waste Containment, and Emerging Waste Management Technologies (Hari Sharma & Krishna Reddy)
Solution manual Natural Hazards : Earth's Processes as Hazards, Disasters and Catastrophes (2nd Ed., Keller & Blodgett)
Solution manual Essentials of Oceanography (9th Ed., Trujillo & Thurman)

Solution manual Exercises for Weather and Climate (6th Ed., Greg Carbone)
Solution manual Fundamentals of Ground Water (Franklin Schwartz & Hubao Zhang)
Solution manual Practical Problems in Groundwater Hydrology (Scott Bair & Terry Lahm)
Solution manual Groundwater Hydrology (3rd Ed., David Keith Todd & Larry Mays)
Solution manual Groundwater Science (Charles Fitts)
Solution manual Frozen Ground Engineering (2nd Ed., Orlando Andersland & Branko Ladanyi)
Solution manual Stormwater Management for Land Development : Methods and Calculations for Quantity Control (Thomas A. Seybert)
Solution manual Urban Hydrology, Hydraulics, and Stormwater Quality : Engineering Applications and Computer Modeling (A. Osman Akan & Houghtalen)
Solution manual Hydraulics in Civil and Environmental Engineering (4th Ed. Andrew Chadwick)
Solution manual Hydrologic Analysis and Design (3rd Ed., Richard H. McCuen)
Solution manual Introduction to Hydrology (5th Ed., Warren Viessman, Jr. , Gary L. Lewis)
Solution manual Fundamentals of Hydraulic Engineering Systems (4th Ed., Robert Houghtalen, A. Osman Akan, Ned H. C. Hwang)
Solution manual Agriculture's Ethical Horizon (Robert Zimdahl)
Solution manual Environmental Contaminants : Assessment and Control (Daniel Vallero)
Solution manual A Problem-Solving Approach to Aquatic Chemistry (James Jensen)
Solution manual Hazardous Waste Management (2nd Ed., Michael LaGrega, Phillip Buckingham & Jeffrey Evans)
Solution manual Environmental Biotechnology : Principles and Applications (1st Ed., Bruce Rittmann & Perry McCarty)
Solution manual Chemistry for Environmental Engineering and Science (5th Ed., Clair Sawyer, Perry McCarty & Gene Parkin)
Solution manual Geology for Engineers and Environmental Scientists (3rd Ed., Alan Kehew)
Solution manual Ocean Waves and Oscillating Systems (Johannes Falnes)
Solution manual Radiation Detection and Measurement (3rd Ed., Glenn Knoll)
Solution manual Probability Concepts in Engineering : Emphasis on Applications to Civil and Environmental Engineering (2nd Ed., Ang & Tang)
Solution manual Hydrology : Water Quantity and Quality Control (2nd Ed., Wanielista, Kersten & Eaglin)
Solution manual Hydrology and Floodplain Analysis (4th Ed., Philip Bedient, Wayne Huber & Baxter Vieux)
Solution manual Hydrology : An Introduction (Brutsaert)
Solution manual Applied Atmospheric Dynamics (Amanda H. Lynch & John J. Cassano)
Solution manual Mid-Latitude Atmospheric Dynamics : A First Course (Jonathan E. Martin)
Solution manual Adjustment Computations : Spatial Data Analysis (4th Ed., Charles Ghilani & Paul Wolf)
Solution manual Adjustment Computations : Spatial Data Analysis (5th Ed., Charles Ghilani)
Solution manual Ecology (4th Ed., Manuel C. Molles)
Solution manual Industrial Ecology and Sustainable Engineering (T. E. Graedel & Braden R. Allenby)
Solution manual Principles of Environmental Science : Inquiry and Applications (4th Ed., Cunningham)
Solution manual Principles of Environmental Science : Inquiry and Applications (5th Ed., Cunningham)
Solution manual Environmental Science : A Global Concern (9th Ed., Cunningham)
Solution manual Environmental Science : A Global Concern (10th Ed., Cunningham)
Solution manual Essential Environmental Science (1st Ed., Edward Keller & Daniel Botkin)

Solution manual Environmental Science : Earth as a Living Planet (6th Ed., Daniel Botkin & Edward Keller)
Solution manual Environmental Science : Earth as a Living Planet (7th Ed., Daniel Botkin & Edward Keller)
Solution manual Environmental Science : Earth as a Living Planet, Canadian Edition (Daniel Botkin & Edward Keller & Isobel Heathcote)
Solution manual Introduction to Marine Biogeochemistry (2nd Ed., Susan Libes)
Solution manual Farm Management (5th Ed., Ronald Kay, William Edwards & Patricia Duffy)
Solution manual Farm Management (6th Ed., Ronald Kay, William Edwards & Patricia Duffy)
Solution manual Environmental Geology (6th Ed., Carla Montgomery)
Solution manual Environmental Geology (7th Ed., Carla Montgomery)
Solution manual Environmental Geology (8th Ed., Carla Montgomery)
Solution manual Environmental Geology (9th Ed., Carla Montgomery)
Solution manual Natural Disasters (4th Ed., Patrick Abbott)
Solution manual Natural Disasters (5th Ed., Patrick Abbott)
Solution manual Natural Disasters (6th Ed., Patrick Abbott)
Solution manual Natural Disasters (7th Ed., Patrick Abbott)
Solution manual Natural Disasters (8th Ed., Patrick Abbott)
Solution manual Geography Information Systems (2nd Ed., Kang-tsung Chang)
Solution manual Meteorology (2nd Ed., Danielson et al.)
Solution manual Fundamentals of Oceanography (4th Ed., Duxbury, Sverdrup)
Solution manual Fundamentals of Oceanography (5th Ed., Duxbury, Sverdrup)
Solution manual Introduction to Geography (8th Ed., Getis et al.)
Solution manual Introduction to Geography (9th Ed., Getis et al.)
Solution manual Introduction to Geography (10th Ed., Getis et al.)
Solution manual Introduction to Geography (11th Ed., Getis et al.)
Solution manual Physical Geology : The Earth Revealed (4th Ed., Plummer, McGeary & Carlson)
Solution manual Physical Geology : The Earth Revealed (6th Ed., Plummer, McGeary & Carlson)
Solution manual Physical Geology : Earth Revealed (7th Ed., Plummer, McGeary & Carlson)
Solution manual Physical Geology (9th Ed., Plummer, McGeary & Carlson)
Solution manual Physical Geology (10th Ed., Plummer, McGeary & Carlson)
Solution manual Physical Geology (11th Ed., Plummer, McGeary & Carlson)
Solution manual Physical Geology (12th Ed., Plummer, McGeary & Carlson)
Solution manual Exploring the World Ocean (W. Sean Chamberlin & Tommy Dickey)
Solution manual Mastering ArcGIS (3rd Ed., Maribeth Price)
Solution manual Mastering ArcGIS (4th Ed., Maribeth Price)
Solution manual An Introduction to the World's Oceans (7th Ed., Sverdrup et al.)
Solution manual An Introduction to the Worlds Oceans (8th Ed., Sverdrup et al.)
Solution manual An Introduction to the Worlds Oceans (9th Ed., Sverdrup & Armbrust)
Solution manual An Introduction to the Worlds Oceans (10th Ed., Sverdrup & Armbrust)
Solution manual Laboratory Studies in Earth History (8th Ed., Brice et al.)
Solution manual Laboratory Studies in Earth History (9th Ed., Brice et al.)
Solution manual Exploring Geology (1st Ed., Reynolds et al.)
Solution manual Manual of Mineral Science (23rd Ed., Cornelis Klein & Barbara Dutrow)
Solution manual Isotopes : Principles and Applications (3rd Ed., Gunter Faure & Teresa Mensing)
Solution manual Earth Science : Understanding Environmental Systems (Edgar Spencer)
Solution manual Fundamentals of Weed Science (3rd Ed., Robert Zimdahl)
Solution manual Field and Laboratory Exercises in Animal Behavior (Tillberg, Breed & Hinners)

Solution manual Soils : An Introduction (6th Ed., Michael Singer & Donald Munns)
Solution manual Soils, Land, and Life (Stan Buol)
Solution manual Soils in Our Environment (10th Ed., Raymond Miller & Duane Gardiner)
Solution manual Soils in Our Environment (11th Ed., Raymond Miller & Duane Gardiner)
Solution manual Soil Microbiology, Ecology and Biochemistry (3rd Ed., Eldor Paul)
Solution manual Soil in the Environment : Crucible of Terrestrial Life (Daniel Hillel)
Solution manual Design Analysis in Rock Mechanics (William G. Pariseau)
Solution manual Forest Management and Planning (Bettinger, Boston, Siry & Grebner)
Solution manual Agricultural Systems : Agroecology and Rural Innovation for Development (Sieglinde Snapp & Barry Pound)
Solution manual Plant Systematics (Michael Simpson)
Solution manual The Nature and Properties of Soils (14th Ed., Nyle Brady & Raymond Weil)
Solution manual Elements of the Nature and Properties of Soils (2nd Ed., Nyle Brady & Ray Weil)
Solution manual Materials and the Environment : Eco-informed Material Choice (Michael Ashby)
Solution manual Materials and the Environment : Eco-informed Material Choice (2nd Ed., Michael Ashby)

List of Solutions Manuals and Test Banks

---

contact to : mattosbw1@gmail.com mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

I do not review the forums, just send me an email. Please do not use emails from servers "LIVE" , all they are take as spam emails in my inbox.

- Mechanics, Mechanical Engineering & Aerospace Engineering:

Solution Manual Classical Mechanics (Douglas Gregory)
Solution Manual Classical Mechanics : From Newton to Einstein : A Modern Introduction (2nd Ed., Martin McCall)
Solution Manual Advanced Dynamics (Donald T. Greenwood)
Solution Manual Principles of Dynamics (2nd Ed., Donald T. Greenwood)
Solution Manual Advanced Engineering Dynamics (2nd Ed., Jerry Ginsberg)
Solution Manual Classical Dynamics (Jorge V. José)
Solution Manual Impact Mechanics (W.J. Stronge)
Solution Manual Human Body Dynamics (Aydin Tozeren)
Solution Manual Statistical Mechanics (2nd Ed., R.K. Pathria)
Solution Manual Statistical Mechanics (3rd Ed., R.K. Pathria & Paul D. Beale)
Solution Manual Engineering Mechanics of Solids (2nd Ed., Egor P. Popov)
Solution Manual Introduction to Continuum Mechanics (4th Ed., W. Michael Lai, David Rubin & Erhard Krempl)
Solution Manual Analytical Mechanics (7th Ed., Grant R. Fowles, George Cassiday)
Solution Manual Introduction to Mechanical Engineering (Rizza)
Solution Manual Engineering Fundamentals and Problem Solving (4th Ed., Eide, Jenison, Mashaw & Northup)
Solution Manual Engineering Fundamentals and Problem Solving (5th Ed., Eide, Jenison, Northup & Mickelson)
Solution Manual Engineering Fundamentals and Problem Solving (6th Ed., Eide, Jenison, Northup & Mickelson)
Solution Manual Mechanical Engineering Principles (Bird & Ross)
Solution Manual Dynamics of Mechanical Systems (C.T.F. Ross)
Solution Manual Mechanics of Solids (C.T.F. Ross)
Solution Manual Introduction to Engineering Analysis (1st Ed., Hagen)

Solution Manual Introduction to Engineering Analysis (2nd Ed., Hagen)
Solution Manual Introduction to Engineering Analysis (3rd Ed., Hagen)
Solution Manual Engineering Design (Rudolph J. Eggert)
Solution Manual Creative Design of Products and Systems (Saeed Niku)
Solution Manual Fundamentals of Engineering Design (2nd Ed., Barry Hyman)
Solution Manual Engineering Design (4th Ed., George Dieter & Linda Schmidt)
Solution Manual Engineering Design (5th Ed., George Dieter & Linda Schmidt)
Solution Manual Engineering Design and Graphics with Autodesk Inventor 2009 (James Bethune)
Solution Manual Engineering Design : A Project-Based Introduction (2nd Ed., Clive Dym & Patrick Little)
Solution Manual Engineering Design : A Project-Based Introduction (3rd Ed., Clive Dym & Patrick Little)
Solution Manual Tools and Tactics of Design (Dominick, Demel, Lawbaugh, Freuler, Kinzel & Fromm)
Solution Manual Biofluid Mechanics - An Introduction to Fluid Mechanics, Macrocirculation, and Microcirculation (David Rubenstein, Wei Yin & Mary Frame)
Solution Manual Advanced Fluid Mechanics (William Graebel)
Solution manual Modern Fluid Dynamics (Clement Kleinstreuer)
Solution manual Essential Computational Fluid Dynamics (Oleg Zikanov)
Solution Manual Computational Fluid Dynamics : A Practical Approach (Jiyuan Tu, Guan Heng Yeoh & Chaoqun Liu)
Solution Manual Mechanics of Fluids (8th Ed., Massey)
Solution Manual Fluid Mechanics (5th Ed., Frank White)
Solution Manual Fluid Mechanics (6th Ed., Frank White)
Solution Manual Fluid Mechanics (7th Ed., Frank White)
Solution Manual Viscous Fluid Flow (3rd Ed., Frank White)
Solution Manual Statistical Thermodynamics (Normand Laurendeau)
Solution Manual Introductory Statistical Thermodynamics (Nils Dalarsson , Mariana Dalarsson & Leonardo Golubovic)
Solution Manual Thermodynamics and Heat Power (6th Ed., Kurt C. Rolle)
Solution Manual Modern Engineering Thermodynamics (Robert Balmer)
Solution Manual Introduction to the Thermodynamics of Materials (4th Ed. David Gaskell)
Solution Manual Introduction to Thermodynamics and Heat Transfer (2nd Ed., Yunus Cengel)
Solution Manual Thermal Design : Heat Sinks, Thermoelectrics, Heat Pipes, Compact Heat Exchangers, and Solar Cells (HoSung Lee)
Solution Manual Fundamentals of Thermal-Fluid Sciences (1st Ed., Yunus Cengel)
Solution Manual Fundamentals of Thermal-Fluid Sciences (2nd Ed., Yunus Cengel)
Solution Manual Fundamentals of Thermal-Fluid Sciences (3rd Ed., Yunus Cengel & Robert Turner)
Solution Manual Fundamentals of Thermal-Fluid Sciences (4th Ed., Yunus Cengel , Robert Turner & John Cimbala)
Solution Manual Thermodynamics : An Engineering Approach (5th Ed., Yunus Cengel)
Solution Manual Thermodynamics : An Engineering Approach (6th Ed., Yunus Cengel & Michael Boles)
Solution Manual Thermodynamics : An Engineering Approach (7th Ed., Yunus Cengel & Michael Boles)
Solution Manual Essentials of Fluid Mechanics : Fundamentals and Applications (1st Ed., Yunus Cengel, John Cimbala)
Solution Manual Fluid Mechanics (1st Ed., Yunus Cengel & John Cimbala)

Solution Manual Fluid Mechanics (2nd Ed., Yunus Cengel & John Cimbala)
Solution Manual Heat Tranfer (2nd Ed., Yunus Cengel)
Solution Manual Heat and Mass Transfer : A Practical Approach (3rd Ed., Yunus Cengel)
Solution Manual Heat and Mass Transfer : Fundamentals and Applications (4th Ed., Yunus Cengel & Afshin Ghajar)
Solution Manual Introduction to Fluid Mechanics (6th Ed., Robert Fox, Alan McDonald & Philip Pritchard)
Solution Manual Introduction to Fluid Mechanics (7th Ed., Robert Fox, Philip Pritchard & Alan McDonald)
Solution Manual Fox and McDonald's Introduction to Fluid Mechanics (8th Ed., Philip Pritchard)
Solution Manual Fluid Mechanics (5th Ed., Douglas)
Solution Manual Fluid Mechanics (3rd Ed., Kundu & Cohen)
Solution Manual Fluid Mechanics (4th Ed., Kundu & Cohen)
Solution Manual Fluid Mechanics (5th Ed., Kundu , Cohen & Dowling)
Solution Manual Elementary Fluid Mechanics (7th Ed., Street, Watters & Vennard)
Solution Manual Fluid Mechanics with Engineering Applications (10th Ed., Finnemore & Franzini)
Solution Manual Fundamentals of Fluid Mechanics (4th Ed., Bruce Munson, Donald Young, Theodore Okiishi)
Solution Manual Fundamentals of Fluid Mechanics (5th Ed., Bruce Munson, Donald Young, Theodore Okiishi)
Solution Manual Fundamentals of Fluid Mechanics (6th Ed., Bruce Munson, Donald Young, Theodore Okiishi, Wade Huebsch)
Solution Manual Fundamentals of Fluid Mechanics - SI Units (6th Ed., Bruce Munson, Donald Young, Theodore Okiishi, Wade Huebsch)
Solution Manual Fundamentals of Fluid Mechanics (7th Ed., Bruce Munson, Theodore Okiishi, Wade Huebsch, Alric Rothmayer)
Solution Manual A Brief Introduction to Fluid Mechanics (3rd Ed., Donald Young, Bruce Munson, Theodore Okiishi)
Solution Manual A Brief Introduction to Fluid Mechanics (4th Ed., Donald Young, Bruce Munson, Theodore Okiishi, Wade Huebsch)
Solution Manual A Brief Introduction to Fluid Mechanics (5th Ed., Donald Young, Bruce Munson, Theodore Okiishi, Wade Huebsch)
Solution Manual Engineering Fluid Mechanics (7th Ed., Clayton Crowe, Donald Elger, John Roberson)
Solution Manual Engineering Fluid Mechanics (8th Ed., Clayton Crowe, Donald Elger, John Roberson)
Solution Manual Engineering Fluid Mechanics (9th Ed., Clayton Crowe, Donald Elger, John Roberson, Barbara Williams)
Solution Manual Engineering Fluid Mechanics - SI Version (9th Ed., Clayton Crowe, Donald Elger, John Roberson, Barbara Williams)
Solution Manual Fluid Mechanics (Potter & Foss)
Solution Manual Mechanics of Fluids (3rd Ed., Potter)
Solution Manual Fluid Power with Applications (7th Ed., Esposito)
Solution Manual Mechanics of Fluids (4th Ed., Shames)
Solution Manual Applied Fluid Mechanics (6th Ed., Mott)
Solution Manual Applied Fluid Mechanics - SI Units (6th Ed., Mott)
Solution Manual Hydraulic Control Systems (Noah Manring)
Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (5th Ed., S.L. Dixon)

Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (6th Ed., S.L. Dixon & Cesare Hall)
Solution Manual The Design of High-Efficiency Turbomachinery and Gas Turbines (2nd Ed., David Gordon Wilson & Theododios Korakianitis)
Solution Manual Fundamentals of Turbomachinery (William Peng)
Solution Manual Principles of Turbomachinery in Air-Breathing Engines (Baskharone)
Solution Manual Theory of Aerospace Propulsion (Pasquale Sforza)
Solution Manual Fundamentals of Jet Propulsion with Applications (Ronald D. Flack)
Solution Manual Extended Irreversible Thermodynamics (3rd Ed., D. Jou, J. Casas-Vazquez & G. Lebon)
Solution Manual Thermodynamics : An Integrated Learning System (Schmidt, Ezekoye, Howell & Baker)
Solution Manual Design of Fluid Thermal Systems (2nd Ed., William Janna)
Solution Manual Design and Simulation of Thermal Systems (N.V. Suryanarayana & Oner Arici)
Solution Manual Introduction to Thermal and Fluids Engineering (Kaminski & Jensen)
Solution Manual Heating, Ventilating and Air Conditioning Analysis and Design (6th Ed., McQuiston)
Solution Manual Heating, Ventilation, and Air Conditioning in Buildings (1st Ed., John W. Mitchell, James E. Braun)
Solution manual Heating and Cooling of Buildings : Design for Efficiency (2nd Ed., Jan Kreider, Peter Curtiss & Ari Rabl)
Solution Manual Electricity, Electronics, and Control Systems for HVAC (4th Ed., Thomas Kissell)
Solution Manual Heat and Mass Transfer (Anthony Mills)
Solution Manual Heat Transfer (2nd Ed., A.F. Mills)
Solution Manual Basic Heat and Mass Transfer (2nd Ed., A.F. Mills)
Solution Manual Convective Heat and Mass Transfer (4th Ed., Kays & Crawford)
Solution Manual Advanced Engineering Thermodynamics (3rd Ed., Bejan)
Solution Manual Convection Heat Transfer (3rd Ed., Bejan)
Solution Manual Design with Constructal Theory (Adrian Bejan & Sylvie Lorente)
Solution Manual Shape and Structure, from Engineering to Nature (Adrian Bejan)
Solution Manual Thermodynamics : Concepts and Applications (Stephen Turns)
Solution Manual Experimental Methods for Engineers (8th Ed., Jack P. Holman)
Solution Manual Heat Transfer (10th Ed., Jack Holman)
Solution Manual Principles of Heat Transfer (Kaviany)
Solution Manual Heat Convection (Latif M. Jiji)
Solution Manual Fundamentals of Momentum, Heat and Mass Transfer (5th Ed., Welty)
Solution Manual Analytical Methods for Heat Transfer and Fluid Flow Problems (Bernhard Weigand)
Solution Manual An Introduction to Fluid Dynamics : Principles of Analysis and Design (Stanley Middleman)
Solution Manual An Introduction to Mass and Heat Transfer : Principles of Analysis and Design (Stanley Middleman)
Solution Manual Fundamentals of Thermodynamics (5th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (6th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (7th Ed., Claus Borgnakke & Richard Sonntag)
Solution Manual Introduction to Engineering Thermodynamics (1st Ed., Richard Sonntag &

Claus Borgnakke)
Solution Manual Introduction to Engineering Thermodynamics (2nd Ed., Richard Sonntag & Claus Borgnakke)
Solution Manual Fundamentals of Engineering Thermodynamics (5th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics - SI Units (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (7th Ed., Michael Moran, Howard Shapiro, Daisie Boettner, Margaret Bailey)
Solution Manual Fundamentals of Heat and Mass Transfer (5th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Fundamentals of Heat and Mass Transfer (6th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Fundamentals of Heat and Mass Transfer (7th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Introduction to Heat Transfer (4th Ed., Incropera, DeWitt)
Solution Manual Introduction to Heat Transfer (5th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Introduction to Heat Transfer (6th Ed., Incropera, DeWitt, Bergman, Lavine)
Solution Manual Radiation Detection and Measurement (3rd Ed., Glenn Knoll)
Solution Manual Radiation Detection and Measurement (4th Ed., Glenn Knoll)
Solution Manual Radiative Heat Transfer (2nd Ed., Michael Modest)
Solution Manual Principles of Combustion (2nd Ed., Kenneth Kuan-yun Kuo)
Solution Manual An Introduction to Combustion : Concepts and Applications (3rd Ed., Stephen R. Turns)
Solution Manual Combustion (2nd Ed., Irvin Glassman)
Solution Manual Combustion (3rd Ed., Irvin Glassman)
Solution Manual Combustion (4th Ed., Irvin Glassman)
Solution Manual Incompressible Flow (3rd Ed., Panton)
Solution Manual Modern Compressible Flow : With Historical Perspective (3rd Ed., John Anderson)
Solution Manual Non-Newtonian Flow : Fundamentals and Engineering Applications (R.P. Chhabra & J F Richardson)
Solution Manual Computational Techniques for Fluid Dynamics (Srinivas, K., Fletcher, C.A.J.)
Solution Manual Introduction to Computational Fluid Dynamics (A.W. Date)
Solution Manual Robot Modeling and Control (Spong, Hutchinson & Vidyasagar)
Solution Manual Introduction to Robotics : Mechanics and Control (3rd Ed., John J. Craig)
Solution Manual Introduction to Robotics: Analysis, Control, Applications (2nd Ed., Saeed B. Niku)
Solution Manual Theory of Applied Robotics : Kinematics, Dynamics and Control (Reza N. Jazar)
Solution Manual Control of Robot Manipulators in Joint Space (R. Kelly, V. Santibáñez, A. Loría)
Solution Manual Modelling and Control of Robot Manipulators (2nd Ed., Lorenzo Sciavicco, Bruno Siciliano)
Solution Manual Robotics : Modelling, Planning and Control (Bruno Siciliano, Lorenzo Sciavicco, Luigi Villani & Giuseppe Oriolo)

Solution Manual Fundamentals of Robotic Mechanical Systems : Theory, Methods, and Algorithms (3rd Ed., Jorge Angeles)
Solution Manual Kinematic Chains and Machine Components Design (Dan B. Marghitu)
Solution Manual Kinematics, Dynamics, and Design of Machinery (2nd Ed., Waldron & Kinzel)
Solution Manual Kinematics and Dynamics of Machinery (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Kinematics and Dynamics of Machinery - SI Units (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (3rd Ed., David H. Myszka)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (4th Ed., David H. Myszka)
Solution Manual Mechanism Design : Analysis and Synthesis (4th Ed., Erdman, Sandor & Kota)
Solution Manual Mechanical Design : A Components Approach (2nd Ed., Peter Childs)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (1st Ed., Collins)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (2nd Ed., Collins, Busby & Staab)
Solution Manual Fundamentals of Machine Component Design (3rd Ed., Juvinall)
Solution Manual Fundamentals of Machine Component Design (4th Ed., Juvinall & Marshek)
Solution Manual Fundamentals of Machine Component Design (5th Ed., Juvinall & Marshek)
Solution Manual Design of Machine Elements (8th Ed., Spotts)
Solution Manual Machine Elements in Mechanical Design (4th Ed., Mott)
Solution Manual Machine Elements in Mechanical Design - SI Units (4th Ed., Mott)
Solution Manual Mechanical Design : An Integrated Approach (1st Ed., Ansel Ugural)
Solution Manual Design of Machinery (3rd Ed., Norton)
Solution Manual Design of Machinery (4th Ed., Norton)
Solution Manual Design of Machinery (5th Ed., Norton)
Solution Manual Machine Design : An Integrated Approach (3rd Ed., Norton)
Solution Manual Machine Design : An Integrated Approach (4th Ed., Norton)
Solution Manual Mechanical Engineering Design (6th Ed., Shigley)
Solution Manual Mechanical Engineering Design (7th Ed., Shigley, Mischke & Budynas)
Solution Manual Shigley's Mechanical Engineering Design (8th Ed., Budynas & Nisbett)
Solution Manual Shigley's Mechanical Engineering Design (9th Ed., Budynas & Nisbett)
Solution Manual Fundamentals of Machine Elements (1st Ed., Hamrock)
Solution Manual Fundamentals of Machine Elements (2nd Ed., Hamrock)
Solution Manual Mechanics of Materials (Paul S. Steif)
Solution Manual Mechanics of Materials : A Modern Integration of Mechanics and Materials in Structural Design (Christopher Jenkins & Sanjeev Khanna)
Solution Manual Mechanics of Materials (3th Ed., Beer)
Solution Manual Mechanics of Materials (5th Ed., Gere & Timoshenko)
Solution Manual Mechanics of Materials (6th Ed., Gere & Timoshenko)
Solution Manual Mechanics of Materials (7th Ed., Gere & Goodno)
Solution Manual Mechanics of Materials (Ansel Ugural)
Solution Manual Mechanics of Materials : An Integrated Learning System (1st Ed., Timothy Philpot)
Solution Manual Mechanics of Materials : An Integrated Learning System (2nd Ed., Timothy Philpot)
Solution Manual Mechanics of Materials (2nd Ed., Roy R. Craig)
Solution Manual Mechanics of Materials (3rd Ed., Roy R. Craig)

Solution Manual Simplified Mechanics and Strength of Materials (6th Ed., James Ambrose)
Solution Manual Engineering Applications of Dynamics (Dean Karnopp & Donald Margolis)
Solution Manual Engineering Mechanics : Statics (Arthur Boresi, Richard Schmidt)
Solution Manual Engineering Mechanics : Dynamics (Arthur Boresi, Richard Schmidt)
Solution Manual Engineering Mechanics : Statics (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics - SI Version (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics - SI Version (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics (7th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics - SI Version (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics - SI Version (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics (7th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Vector Mechanics for Engineers : Statics (7th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Statics (8th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Dynamics (7th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Dynamics (8th Ed., Ferdinand Beer)
Solution Manual Statics : Analysis and Design of Systems in Equilibrium (Sheppard & Tongue)
Solution Manual Statics : Analysis and Design of Systems in Equilibrium - Update Edition (Sheppard & Tongue)
Solution Manual Dynamics : Analysis and Design of Systems in Motion (Sheppard & Tongue)
Solution Manual Dynamics : Analysis and Design of Systems in Motion (2nd Ed., Sheppard & Tongue)
Solution Manual Statics and Mechanics of Materials : An Integrated Approach (2nd Ed., Riley, Sturges & Morris)
Solution Manual Mechanics of Materials (6th Ed., Riley, Sturges & Morris)
Solution Manual Computational Methods in Elasticity and Plasticity : Solids and Porous Media (A. Anandarajah)
Solution Manual Basic Engineering Plasticity : An Introduction with Engineering and Manufacturing Applications (David Rees)
Solution Manual Theory of Plasticity (3rd Ed. Jagabanduhu Chakrabarty)
Solution Manual Deformation and Fracture Mechanics of Engineering Materials (4th Ed., Richard Hertzberg)
Solution Manual Deformation and Fracture Mechanics of Engineering Materials (5th Ed., Richard Hertzberg, Richard Vinci, Jason Hertzberg)
Solution Manual Deformable Bodies and Their Material Behavior (Haslach & Armstrong)
Solution Manual Intermediate Mechanics of Materials (1st Ed., Barber)
Solution Manual Elasticity (2nd Ed., J.R. Barber)
Solution Manual Elasticity : Theory, Applications, and Numerics (1st Ed., Martin Sadd)
Solution Manual Elasticity : Theory, Applications, and Numerics (2nd Ed., Martin Sadd)
Solution Manual Elasticity in Engineering Mechanics (2nd Ed., Boresi)
Solution Manual Elasticity in Engineering Mechanics (3rd Ed., Boresi, Chong, Lee)
Solution Manual Advanced Mechanics of Materials and Applied Elasticity (5th Ed., Ansel C. Ugural & Saul K. Fenster)
Solution Manual Advanced Mechanics of Materials (6th Ed., Boresi)

Solution Manual Advanced Mechanics of Materials (2nd Ed., Cook & Young)
Solution Manual Metal Fatigue in Engineering (2nd Ed., Stephens, Fatemi & Fuchs)
Solution Manual Applied Mechanics for Engineering Technology (8th Ed., Keith M. Walker)
Solution Manual Applied Statics and Strength of Materials (5th Ed. Limbrunner & Spiegel)
Solution Manual Statics and Strength of Materials (Robert Mott)
Solution Manual Applied Strength of Materials (4th Ed., Mott)
Solution Manual Applied Strength of Materials (5th Ed., Mott)
Solution Manual Intermediate Dynamics for Engineers (Marcelo R.M & Crespo da Silva)
Solution Manual Engineering Mechanics : Statics (Michael Plesha, Gary Gray & Francesco Costanzo)
Solution Manual Engineering Mechanics : Statics (2nd Ed., Michael Plesha, Gary Gray & Francesco Costanzo)
Solution Manual Engineering Mechanics : Dynamics (Michael Plesha, Gary Gray & Francesco Costanzo)
Solution Manual Engineering Mechanics : Statics (4th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Statics (5th Ed., Anthony Bedford & Wallace Fowler)

We (the group excluding Szczepan) have some good discussions.
Szczepan can be amusing in the views he puts forward. I can't work out whether he is trying to tease us or really is confused.

I suppose there's also the hope that Szczepan might read and understand the information that some of us are showing him. It's a bit like trying to explain radio to a youngster except that a youngster will listen and learn. Szczepan's idea of using a well to get an infinite supply of electrons made me smile. We've a lot of disused coal pits in my part of England and it would be great to turn them into electron mines. We could dispense with coal fired power stations, wind turbines, solar cells.
Not sure if the electrons would be packed in bottles (like water) or in sacks (like coal).

73, Ian.

I think it is not productive to reply to every posting with "you are
a babbling idiot". That is not going to convince him that he is, and
it just annoys the others.

When you ask him real questions, he either does not answer or he digs up
some prehistoric finding that may have been accurate at that time, but
can easily be disproven today.

For example, his theory that an antenna acts like a vacuum diode, emitting
electrons during one phase of the HF voltage and not taking them back
during the next phase, clearly must be wrong. If it were true, an antenna
would be a nonlinear element that would cause intermodulation. As we
don't see that happen on a well-designed antenna (it *does* happen when
there are bad contacts with diode-effect in the antenna), we know that
an antenna by itself cannot be nonlinear and so there cannot be a net
flow of electrons.

He cannot dispute that so he wanders of in a different direction.

Hello Rob.
I can't answer your point about the "babbling idiot" postings as I'm not the one who makes them.
Szczepan reminds me of an elderly relative who grew up in the 1920s when electronics was large components on wooden baseboards. They seemed to be developed from mechanical engineering (see if and understand it). It was a challenge to get the relative to understand that any progress had been made since the days of valves. Szczepan seems to have grasped electronics as being the movement of electrons and has muddled that up with air or liquid flow.
Initially, I hoped that a polite explanation would help him but after a few weeks I realised that he's not capable of understanding and learning (always assuming that he isn't an Extra Class licensee having a big laugh - which is why I enjoy the humour in his postings).
He seems to go around in circles lasting several weeks - I think that the thoughts in some of his recent postings are similar to ones he made a month or more ago.

73, Ian.

In EM the electricity is like the LIQUID flow (incompressible and massles).
In electronics is GAS flow. Electron gas. Electrons have mass.

Do you see the difference between massive GAS and massles LIQUID?

Szczepan, you say that liquids are massles (I assume that you means
massless). This is definitely wrong. Thanks for the laugh.
Regards, Ian.

In 1884 Heavisde wrote the EM. He assumed that electricity and magnetism are
like the massless liquid.

Hello Szczepan. Liquids definitely are not massless.

The antenna always has the counterpoise:
"A counterpoise which consists of one or more wires in a network insulated
from the ground will often reduce loss resistances which might occur when
the quarterwave antenna is connected to poorly conducting earth. The
counterpoise in the case of a network of several wires acts as a condenser
plate with high capacity to earth, with the result of lower loss in the
antenna system; for this reason the counterpoise should be fairly close to
the ground. [See Fig. 1.] "
From: http://www.antennex.com/shack/Dec06/cps.html

Joel dipole has the two legs.
One of them is the antenna and the second the counterpoise.

The net flow of electrons is from the counterpoise to end of antenna.

Always is the "DC" (net electron flow) from the counterpoise to end of an
antenna.

How do you explain that there is no intermodulation as a result of
the nonlinearity of the antenna that you claim?

Hello readers. I've had a busy day on the keyboard and my stubby fingers
are rather tired. Anyone else want to try to explain to Szczepan the
differences between DC and AC. Shall we simply say that
DC = direct current and
AC = alternating current
and there's a big and significant difference between "direct" and
"alternating"?
How about
direct = flat road
alternating = road with hills and valleys?
I think that Szczepan may understand "flat", "hills" and "valleys" but I
wouldn't care to bet on it. Maybe he'll start to quote from National
Geographic.
Wonder what would happen if he plugged his computer into a DC supply rather
than an AC supply?
73, Ian.

On the contrary, his history on sci.phyics.elecromag shows if all his
posts get the same response from everyone, he at least goes away for
a while.

It is utterly hopeless to think he can be educated.

Again, you take a random quote out of context.

The quote is talking about end fed vertical antennas, and ONLY end fed
vertical antennas.

It is NOT true for OTHER types of antennas.

> Joel dipole has the two legs.
> One of them is the antenna and the second the counterpoise.

Nope, measurment of the voltages, currents, and fields show this to be
wrong.

> The net flow of electrons is from the counterpoise to end of antenna.

Amen to that!

Last year, I put up three 30-foot poles to support a 20m dipole at its optimum height. This year, I thought I was gettting off easy with just one pole. Maybe so, but with the top section having a crossarm and the extra weight of the elements and tethers, getting that sucker up the same 30 feet was still an adventure. I'm thinking of something simpler next year and not ruling out being a home station for the first time ever.

I am here to learn.

Lately I have learn from Bilou:
"In such cases it is convenient to put the things to their limits.
Imagine the diameter of one half is infinite.
You now have a quarter wave over a ground plane.A well known case."

It means that a dipole fed from a coax is the monopole (a quarter wave) with
the counterpoise.

"In the case of very rocky or poorly conducting soil a counterpoise often is
substituted for a buried network of wires. A counterpoise is a network of
wires place above the earth a slight distance and insulated from it, so
arranged to produce a very high capacity to the earth."

So I know now why you all claim that a dipole do not need a ground.

The number of radials is the power dependent. More power radiated more
electrons must be taken from a ground.
Do you agree?
S*

Please don't wander off the subject and answer the question!
You did not answer the question why there is no intermodulation
in a transmitter antenna, while you claim it is nonlinear.

Because a dipole does not need a ground, it is a symmetric antenna which
is not driven relative to ground.

Good morning Szczepan.
Here are two questions for you to ponder:
How many radials are needed for a receiving aerial?
Are liquids massless?

Here is something to learn - the monopole and dipole are two different
aerials.

Regards, Ian.

The voltages inside of the computer is DC / not AC.

If he removed the power supply - it would still work on battery power.

No, you are obviously not here to learn.

No matter what you are told from people who have actually been dealing
with antenna systems from years, your response continues to be babbling
nonsense and quotes from century old literature that has long ago proven
to be false.

> Lately I have learn from Bilou:
> "In such cases it is convenient to put the things to their limits.
> Imagine the diameter of one half is infinite.
> You now have a quarter wave over a ground plane.A well known case."

Babble.

> It means that a dipole fed from a coax is the monopole (a quarter wave) with
> the counterpoise.

No, it doesn not mean that.

> "In the case of very rocky or poorly conducting soil a counterpoise often is
> substituted for a buried network of wires. A counterpoise is a network of
> wires place above the earth a slight distance and insulated from it, so
> arranged to produce a very high capacity to the earth."

This is just a random factoid dealing with a particular situation for
a particular antenna type and NOT true in general.

> So I know now why you all claim that a dipole do not need a ground.

No, you do not know anything.

A dipole does NOT need a ground.

> The number of radials is the power dependent. More power radiated more
> electrons must be taken from a ground.
> Do you agree?

No, this is babbling nonsense.

Radials are only required for an end fed monopole.

The number of radial required is dependant on the ground conductivity and
totally independant of power.

It is power dependent.

> Are liquids massless?

Ask Heaviside.
>
> Here is something to learn - the monopole and dipole are two different
> aerials.

I did:
"The dipole antenna, which is the basis for most antenna designs, is a balanced component, with equal but opposite voltages and currents applied at its two terminals through a balanced transmission line (or to a coaxial transmission line through a so-called balun)."

The dipole antenna is the two monopoles.

" The vertical antenna, on the other hand, is a monopole antenna. It is typically connected to the inner conductor of a coaxial transmission line (or a matching network); the shield of the transmission line is connected to ground."

If the antenna has the two legs and the one leg is connected to the shield of the coax we have the monopole.

"In this way, the ground (or any large conductive surface) plays the role of the second conductor of a dipole, thereby forming a complete circuit.[3] Since monopole antennas rely on a conductive ground, a so-called grounding structure may be employed to provide a better ground contact to the earth or which itself acts as a ground plane to perform that function regardless of (or in absence of) an actual contact with the earth." From: http://en.wikipedia.org/wiki/Antenna_(radio)

So: " It means that a dipole fed from a coax is the monopole (a quarter
wave) with the counterpoise." is right.
Do you agree?

""In the case of very rocky or poorly conducting soil a counterpoise often
is substituted for a buried network of wires".

The number of buried radials or that above ground (counterpoise) is power
dependent.
S*

That is not a correct way to feed a dipole!
There must be a balun between the coax and the dipole.

To provide a return for the HF current being fed into an unbalanced
vertical. Not to provide electrons to be emitted.

This is meaningless babble.

While lower level, i.e. grade school textbooks, may contain simplifications,
university level textbooks do not.

I would bet heavily that you have never read any textbook beyond the grade
school level.

>>> Lately I have learn from Bilou:

There is nothing that requires a dipole to be connected to coax.

In fact many dipoles are connected to balanced line all the way to the
transmitter.

Those that are connected with coax usually have device between the coax
and the dipole to convert from unbalance to balanced.

Again you show you know nothing about antennas or the real world.

>>> The number of radials is the power dependent. More power radiated more

One more time, the number of radials needed for good perfomance for an end
fed monopole, and ONLY an end fed monopole, depends ONLY on the ground
conductivity.

Dipoles do NOT need radials.

Yagis do NOT need radials.

Loops do not need radials.

Slots do not need radials.

Horns do not need radials.

Rhombics do not need radials.

Stermba curtains do not need radials.

Log-periodics do not need radials.

Helicals do not need radials.

Only end fed monopoles need radials.

No, you do not.

You glossed right over the part in your own qoute that says: "or to a coaxial transmission line through a so-called balun".

> "In this way, the ground (or any large conductive surface) plays the role of
> the second conductor of a dipole, thereby forming a complete circuit.[3]

And again, you don't get it.

The above quote is talking about end fed monopoles and ONLY end fed monopoles and has NOTHING to do with dipoles.

> So: " It means that a dipole fed from a coax is the monopole (a quarter
> wave) with the counterpoise." is right.
> Do you agree?

No.

Once again you show you are incapable of reading and understanding your own quotes.

I assume that Joel dipole is feed with a coax. Because: "Many people have
had success in feeding a dipole directly with a coaxial cable feed rather
than a ladder-line. "

Is it the Joel case?

Do you agree that such "dipole" is the monopole?

Good morning Szczepan . Dipoles and monopoles are two different aerials. If
you do not understand the difference then you need to try harder to
understand what you are being told rather than disregarding it.

Regards, Ian.

Good morning again Szczepan. The caption to that diagram is "Coax and
antenna both acting as radiators instead of only the antenna."
Note carefully - coax AND antenna BOTH acting as radiators. Directly below
that illustration is another one showing the usual operation of a dipole.

Regards, Ian.

The color someone used in an illustrative diagram has no significance
in the operation of the antenna.

Both the halves of the dipole are involved in the radiation.

Once again you totally fail to understand your own link.

BOTH elements radiate equally as shown by theory and by measurement.

You are a babbling idiot.

Which means nothing by taking the image out of context.

If you were to read http://en.wikipedia.org/wiki/Dipole_antenna and actually
understand what it says, you would then understand why one side is shown as
red and one side is shown as blue.

You would also learn that BOTH sides are radiating equally.

> http://en.wikipedia.org/wiki/File:Dipolewidebandbalun.png

Again you show you know nothing about antennas, the real world or the
links you post.

> I am here to learn.
> S*

An outright lie.

If you were here to learn, you would not be arguing with people who have
spent decades building and using antennas in the real world, people ranging
in education from knowledgable hobbyiests to degreed engineers and scientists.

Not "if", moron, always.

READ your own link.

If a dipole is fed with coax AND if there is NO balun device, then common
mode current flows on the outside of the coax and the coax ALSO radiates.

If a dipole is fed with coax AND if there IS a balun device, then there
is no feedline radiation.

In either case, the dipole radiates from both halves.

That is what your link says happens but you are too stupid to read it and
can only look at the pictures and misinterpret what they mean.

That may be true, however you appear to be too stupid to understand any of
them and just misinterpret the pictures.

Your latest babbling nonsense about the page at:
http://www.deltadx.net/ABCDx/Sections/Antennas.htm

proves you just look at the pictures and either don't read or don't understand
the text.

> Are you one of them?
> S*

Am I one of what?

If you mean what are MY qualifications to call you a babbling idiot, I have
been building and using antennas for about 50 years and have a degree in
Electrical and Electronic Engineering.

How long have you been building and using antennas and what degrees do
you have?

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:
```

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Try to grasp that:

The Marconi antenna is vertical. It consists of an antena and the
counterpoise. The counterpoise can be in form of the vertical wire. So such
monopole is vertical.

The "dipole" antenna with the coax and without the balun is exactly like te
above set.
The only difference is that the second set is horizontal.
Too difficult?

"Try to grasp that:

The Marconi antenna is vertical. It consists of an antenna and the
counterpoise. The counterpoise can be in form of the vertical wire. So such
monopole is vertical.

The "dipole" antenna with the coax and without the balun is exactly like the
above set.
The only difference is that the second set is horizontal.
Too difficult?

Instead writting the "babbling idiot" write a long article on antennas
without ground.

You wrote: "Only end fed monopoles need radials". Do you mean that "Only end
fed monopoles need ground"?

When you have a vertical 1/4 wavelength antenna with a vertical 1/4
wavelength "counterpoise" below it, you don't have a monopole, you
have a dipole.

> The "dipole" antenna with the coax and without the balun is exactly like the

It can be horizontal or vertical or anywhere in between.

Jimp wrote: "Only end fed monopoles need radials".
Marconi wrote that all antennas needs ground.

It is obvious that "the antenna with the two legs where the one leg is
connected to the shield of a coax" is the Marconi antenna.
It is not the dipole antenna.

The rest of your antennas (small power) can have the ground from AC supply
or chassis.

The real dipole need the ladder line (the two wires).
The coax shield is connected to the ground.
You should write "dipole". In NASA their dipole and your"dipole" are the
quite different things.

No, it is not "obvious", it is nonsense to call a dipole a Marconi antenna.
```

A Marconi antenna by definition is an end fed monopole one quarter wavelength high.

> It is not the dipole antenna.

A dipole most certainly IS a dipole.

> The rest of your antennas (small power) can have the ground from AC supply
> or chassis.

Babbling nonsense.

You are an ignorant, ineducable idiot.

Why as there already exists thousands and thousands of such literature
references?

Howver you are too much of an ignorant, ineducable, babbling idiot to be
able to read any of them and understand them.

You were totally unable to understand something as simple as:

http://en.wikipedia.org/wiki/Dipole_antenna

and started babbling about the colors on the graphics showing you haven't
a clue what the article was actually saying.

> You wrote: "Only end fed monopoles need radials". Do you mean that "Only end
> fed monopoles need ground"?

No, I meant what I said.

You, however, are too much of an ignorant, ineducable, babbling idiot to be able to understand it.

To be precise, only end fed monopoles need a counterpoise.

The counterpoise can consist of either radials, a large conductive area fabricated for the purpose, or the Earth itself IF the surface conductivity is high enough.

The words "ground", "radial", and "counterpoise" in relation to antennas are three diffent things with three different meanings but you are too much of an ignorant, ineducable, babbling idiot to be to understand that.

A quarter wave, end fed vertical monopole with a set of radials does NOT need a connection to ground.

The radials serve as the counterpoise.

As you are an ignorant, ineducable, babbling idiot you will not understand any of this and will reply with babbling nonsense.

No, it can not as by definition a Marconi antenna is a quarter wave, end fed
vertical fed against ground.

>
> The "dipole" antenna with the coax and without the balun is exactly like te
> above set.

No, it is not as the generally used meaning of the word "dipole" without
any qualifiers is a half wave, center fed antenna of any orientation but
MOST are oriented horizontally.

> The only difference is that the second set is horizontal.

The difference is one is a quarter wave long and end fed and the other is
a half wave long and center fed.

> Too difficult?

Yes, that is too difficult for an ignorant, ineducable, idiot like you to understand.

Brilliant! I wish there were some way to preserve these teachings.

Maybe I can take a course and learn how to write. Then, if I had a pencil,
I could copy it all down, if I had some paper. Would that work?

Which is why I made my reference to Allen Funt of "Candid Camera." Funt created preposterous situations and yet people tried their darndest to make something real out of it.

I recall a car with no engine whose driver rolled it downhill into a service station. The driver, Funt's attractive co-host, insisted that she had driven around town all day and wanted the mechanic to check the car because it didn't seem to have much power. In a perfect world, when the mechanic popped the hood, he would have laughed and the "bit" would be spoiled. But no! He tried eight ways to explain to her that she COULDN'T have been driving around town. She just sweetly continued the hoax as several other mechanics came over to check out the action. Classic!

Szczepan is that car with no engine and we are those mechanics. :-)

"The quarter wavemonopole antenna is a single element antenna fed at one
end, that behaves as a dipole antenna."

Are you able to understand something as simple as the above?

>>
> To be precise, only end fed monopoles need a counterpoise.
>
> The radials serve as the counterpoise.

The Author in Wiki describes the "dipole" used by radio-amateurs.
Such dipole is simply "The quarter wavemonopole antenna".

Radio-amateurs have "dipole" where one leg is end fed and the other is
connected to the grounded shield of the coax.

You should know that the true dipole is directional.
Are your "dipoles" directional?

"The Hertzian dipole Consider two small spherical conductors connected by a
wire. Suppose that electric charge flows periodically back and forth between
the spheres."

In " NASA" antennas (eg. phase radars) the each "sphere" is fed from special
feeder.
If are the two sphere we have a dipole (Hertzian dipole).

In Marconi antenna is only one "sphere". It is the monopole.
Do you have exactly the same voltages in the both ends of your "dipole"?

The braid = the shield.

The braid and the arm are together the counterpoise.

Have you the same voltages on the braid and on the coax "live" wire?

If not, than you heve the monopole. But it is nothing wrong if in your
community it is call "dipole".

You seem to think that the braid of the coax is a ground and the
voltage there is always zero.

But that is not how things work.

A length of cable, whatever cable it is, is not a short circuit on HF.

Hello Szczepan. The monopole and dipole aerials are definitely two different aerials and it would be wrong to call a monopole a dipole.
It seems that you need some help to understand aerials. The ARRL (http://www.arrl.org/shop/Antennas/) and RSGB (http://www.rsgbshop.org/acatalog/Online_Catalogue_Antennas_37.html) both sell helpful books on aerials.

Kindest regards, Ian.

Monopole antenna: "One side of the antenna feedline is attached to the lower end of the monopole, and the other side is attached to the ground plane, which is often the Earth."

Dipole antenna: "A dipole antenna is a straight electrical conductor measuring 1/2 wavelength from end to end and connected at the center to a radio-frequency (RF) feed line. This antenna, also called a doublet, is one of the simplest types of antenna, and constitutes the main RF radiating and receiving element in various sophisticated types of antennas. The dipole is inherently a balanced antenna, because it is bilaterally symmetrical. Ideally, a dipole antenna is fed with a balanced, parallel-wire RF transmission line"

The Hertz dipole was symmetrical.

The radio-amateurs use the name "dipole" for a monopole.
It is not wrong because they do not use the name monopole.

```
Hello Szczepan.
Your definition of a dipole is wrong. A dipole is not a "straight electrical
conductor measuring 1/2 wavelength ".
```

Yes, and obviously you can not.

What it means is the total FIELD is the same as if the antenna were a dipole.

Nothing more, nothing less.

A dipole is a dipole is a dipole and it doesn't matter who is using it.

A dipole is NOT "The quarter wavemonopole antenna".

A dipole is a dipole is a dipole.

You STILL can not understand the difference and you never will as you are
an ineducable idiot.

How many antennas have you built in your lifetime?

No, they are not, you babbling idiot.

> Have you the same voltages on the braid and on the coax "live" wire?

Not without a ballancing device of some sort.
```

> If not, than you heve the monopole.

What an utter idiot; a monopole has one physical element while a dipole has two physical elements.

That is the meaning of the prefixes "mono", which means one, and "di", which means two.

You are a babbling, ineducable, idiot.

How many antennas have you built in your lifetime?

A dipole is fed with a balancing device of some sort between the
transmission line and the antenna of the transmission line is unbalanced.

Than is how EVERYONE does it, not just radio amateurs.

And the shield of the coax is often NOT grounded nor is it required to be
grounded for the antenna to operate properly.

If it is grounded, it is for OTHER reasons than antenna operation such
as electrical safety or the elimination of static build up, which has
absolutely NOTHING to do with the antenna operationg as an antenna.

> You should know that the true dipole is directional.
> Are your "dipoles" directional?

Dipoles are not directional, they are bidirectional in the plane of the
antenna and ALL dipoles are bidirectional in the plane of the antenna.

You are a babbling, ineducable, idiot.

How many antennas have you built in your life time?

This is all just babbling nonsense with no relation to the real world.

You are a babbling, ineducable, idiot.

How many antennas have you built in your lifetime?

1734. JB Weld ball mount antenna thread repair

Newsgroup: rec.radio.amateur.antenna
Date: 2012-07-08 21:28:27 UTC
From: Jeff Liebermann <jeffl@cruzio.com>
Message-ID: <1arjv7lqob37ke2fle0i6ohnh457qsogbd@4ax.com>
Source record: 1401

I have a friend with a problem. He has a rather heavy duty ball mount
on his van, with a 6ft long fiberglass HF antenna of some sorts
attached. No spring between the ball mount and the antenna.
Unfortunately, the antenna unscrewed itself and he was driving around
with the antenna flopping about for many weeks. The result was that
the antenna beat up the 3/8-24 threads in the ball mount end to where
the threads are now stripped out. Fortunately, the antenna end
threads seem intact.

The original plan was to drill out the threads in the ball mount and
install a Helicoil to repair the threads. The problem is that the
Helicoil 3/8-24 kit costs as much as a new ball mount.
<http://www.ebay.com/itm/400302414654> ($32 for the kit)
Either way, he doesn't want to spend the money.

So, instead of rethreading the ball mount, I propose to insert a 1"
long 3/8-24 piece of threaded rod into the ball mount and secure it
with JB Weld, which allegedly contains metal particles. My tests show
that it's still an insulator when hardened, mostly because the metal
particles do not overlap. However, the close fit of the
threads may be sufficient to get some manner of connection.
<http://www.youtube.com/watch?v=9gKYfgIGMlE>

Silver loaded conductive epoxy might provide a better connection, but
the stuff is fairly weak at 900psi compared to JB Weld at 3900psi. It
may not be sufficiently strong to survive the flopping antenna.
<http://www.mgchemicals.com/products/8331.html>

Will JB Weld work?
Or will it get hot due to IR^2 losses due to antenna currents?
Will adding steel filings help?
Is there a better way to do this?
Is there a better adhesive?

Hi, Jeff.
The antenna part threads are ok because it is stainless steel, while the
ball part is some type of pot metal, primarily zinc. The Heicoil will
eventually rust and cause no end of problems.

the correct repair method is to drill and ream the ball part to a known
larger size, perhaps even 1/2 inch. Then press in a stainless steel rod
and cut it flush with the top of the original hole.

Then drill and tap the pressed in piece for 3/8X24 threads.

In California where it never rains, an aluminum rod may be used, but won't last forever. You may also want to seal the top of the plug/ball with a little RTV to ensure car wash water can't get in.

I suppose a clever person could drill and tap the rod 3/8x24 before pressing it into the ball. Might be easier to do the drilling and tapping using a lathe.

Paul, KD7HB

>Will JB Weld work?
>Or will it get hot due to IR^2 losses due to antenna currents?

I suspect it will behave like a high-dissipation-factor capacitor in
series with the antenna current. There will probably be both
resistive loss, and some reactance in the connection... how much of
each I can't predict, and the amounts may not remain stable with time.

>Will adding steel filings help?
>Is there a better way to do this?
>Is there a better adhesive?

Can you separate the "mechanical connection" and "electrical
connection" aspects?

You could use JB Weld, as you intend, to rebuild the mechanical
connection at the base of the whip. Either before or after doing
this, drill a small hole in the ball, and use this to connect a
flexible jumper wire (either solder the wire into the hole, or tap the
hole for a small screw) and connect the other end of the wire to the
base of the whip... in effect a very short, flexible "flying lead".

Another thought... if you under-size the hole you drill for the
threaded rod, you might be able to achieve an interference fit between
the threaded rod and the hole, so that have to press-fit the rod into
place (e.g. with a vise) and you have actual metal-to-metal contact
between the rod and the metal of the ball. You could use some JB Weld
to reinforce the connection, but the Weld would tend to be squeezed
out of the actual contact reason when you force the rod into place.
If you've got a clean metal-to-metal interference fit between rod and
ball, the presence of the JB Weld in the other areas will be
irrelevant... it will be "shorted out" by the direct metal contact
areas. The JB Weld would act both as a structural reinforcement, and
to exclude oxygen from the interference-fit contact surfaces and help
keep the resistance low over time.

Well, the height over ground will effect the pattern, but it does not
become omnidirectional.

As you get lower in height, the null of a free space or high antenna
starts going away.

At wavelengths over ground:

2, ends are 30 db down from broadside

1, about 22 db down

.5, about 10 db down

.25, about 3 db down

So it approaches omnidirectonal as you get lower but is only omnidirectional
at zero height.

EZNEC is your friend.

Monopole have always the two elements: the antenna and the counterpoise.

> which means two.

So monopole has the one pole. The end of the counterpoise is not the pole.
In your "dipole" the counterpoise is in the form of one elevated radial.

It is your misunderstanding that:

1. amateurs always connect coax directly to a dipole. they don't.
those that are in the know will use a balun.

2. the braid of the coax is "ground". this is not true. there will
be voltage at the braid of the coax at the antenna end when a balun
is not used.

"I have a dipole with 134 feet of 20 gauge insulated copper wire. What
would happen if I wanted to replace one leg (67 feet) with 18 gauge
copper clad insulated steel wire but chose to keep the other leg with
the 20 gauge wire?"

It would be interesting to know what is the reason: corrosion or an
something else.

Also if the leg is the antenna or the counterpoise.

I agree with Bilou: "Joel now has a quarter wave over a ground plane.A well
known case.
Impedance is halved .
Resonance is only dependant of the remaining wire and unchanged."

What materials are recommended for radials (counterpoise) and for the
radiated arm?

In the past, many amateurs did connect coax directly to a dipole. The
reason is that - on most occasions - it worked perfectly well, and they
'got away with it'. It was only when problems occurred (interference to
TV, radio, Hi-Fi etc) that much thought was given to the need for a
balun.

In modern times, there is a lot more opportunity for amateurs to
interfere with - and suffer interference from - all kinds of domestic
equipment, and the use of a balun (or twin feeder) has more-or-less
become an absolute necessity.

>2. the braid of the coax is "ground". this is not true. there will
> be voltage at the braid of the coax at the antenna end when a balun
> is not used.

Szczepan is obviously making the fundamental mistake of thinking that,
because the coax screen is grounded at the transmitter end (or at least
connected to the chassis of the transmitter), it is therefore at zero RF
potential - and that it is still at RF potential at the far (antenna)
end, where it is connected directly to the 'other' leg of the dipole.
This is wrong.

He is then assuming that if the coax screen is at zero RF potential
where it is connected to the other leg of the dipole, then the other leg
of the dipole is also at zero RF potential (and doesn't radiate). This
is wrong.

He is therefore concluding that as both the coax screen and the other
leg of the dipole are at zero RF potential, the only part of the antenna
system that is 'RF live' is the leg of the dipole which is connected to
the inner conductor of the coax - which is what happens with a monopole.
As a result, he is then claiming that a dipole is really only a
monopole. This is wrong.

However, I'm still convinced that Szczepan knows far more about radio than he appears to, and is cunningly trying to get us to explain phenomena which maybe we really don't know as much about as we like to think we do!

The transmission line used to connect to the antenna has absolutely
nothing to do with what kind of antenna a particular antenna is.

Transmission lines and antennas are two separate things.

You are a babbling, ineducable idiot.

> Yours "dipoles" are not symmetrical (electrically0. They are symmetrical
> mechanically.
```

ALL of my dipoles ARE electrically symmetrical as they are fed either with balanced transmission line or there is a balancing device between the transmission line and the antenna.

How many antennas have you built in your lifetime?

I am sure that the other leg radiate almost nothing.
In Hertz time all scientists investigate which part of the Hertz apparature radiate.

I am only claiming that it works like the monopole.
In your literature is wrote that "monopole with the counterpoise works like the dipole". But in your literature the dipole means the mechanical symmetry.

> However, I'm still convinced that Szczepan knows far more about radio than
> he appears to, and is cunningly trying to get us to explain phenomena

Exactly.

But if I am right than the "counterpoise" leg of your dipole should be made of the proper material and have the proper dimenssion not necesary the same as the "live" leg.
So I start the new thread "Joels question".

The history of radio-amateur is so long that that issue is probably solved long ago.

Connect it with coaxial transmission line, idiot.

>>The reason is that - on most occasions - it worked perfectly well, and they
>>'got away with it'. It was only when problems occurred (interference to TV,
>>radio, Hi-Fi etc) that much thought was given to the need for a balun.
>

Since a monopole with radials is an unbalanced load, there is no current
flow on the outside of the coax, idiot.

>> In modern times, there is a lot more opportunity for amateurs to interfere
>> with - and suffer interference from - all kinds of domestic equipment, and

> The twin feeder ensure the electrical symmetry.

Yes, it does, as does a balancing device and coax transmission line, idiot.

>>>2. the braid of the coax is "ground". this is not true. there will

>
> I know that in the coax screen something is induced. But I am sure that
> such "dipole" is not electrically symmetrical.

That is because you are an ignorant, ineducable, idiot.

You have been told and you actually referenced a web link that shows how
a balancing device is used between a coax transmission line and and balanced
load, but no matter how many times you are told this and how many links
you post that say this, you are totally incapable of understanding any of
it.

>> He is then assuming that if the coax screen is at zero RF potential where
>> it is connected to the other leg of the dipole, then the other leg of the

>
> I am sure that the other leg radiate almost nothing.

That is because you are an ignorant, ineducable, idiot.

> In Hertz time all scientists investigate which part of the Hertz apparature
> radiate.

In Hertz's time the instruments to measure the voltages, currents, and
fields didn't exist.

>> He is therefore concluding that as both the coax screen and the other leg

>> system that is 'RF live' is the leg of the dipole which is connected to
>> the inner conductor of the coax - which is what happens with a monopole.
>> As a result, he is then claiming that a dipole is really only a monopole.
>> This is wrong.
>
> I am only claiming that it works like the monopole.

That is because you are an ignorant, ineducable, idiot.

> In your literature is wrote that "monopole with the counterpoise works like
> the dipole". But in your literature the dipole means the mechanical
> symmetry.

That is because you are an ignorant, ineducable, idiot.

What you quoted means the far field for a monopole with a counterpoise is
the same as the far field as a vertical dipole.

It does NOT mean the antenna voltages and currents are the same.

>> However, I'm still convinced that Szczepan knows far more about radio than
>> he appears to, and is cunningly trying to get us to explain phenomena

>> which maybe we really don't know as much about as we like to think we do!
>
> Exactly.

You know NOTHING about radio.

You are a babbling, ignorant, ineducable, idiot.

How many transmitters have you run in your lifetime?

How many antennas have you built in your lifetime?

> But if I am right than the "counterpoise" leg of your dipole should be made
> of the proper material and have the proper dimenssion not necesary the same
> as the "live" leg.

You are NOT right.

Dipoles do not have a counterpoise.

You are a babbling, ignorant, ineducable, idiot.

> So I start the new thread "Joels question".
>
> The history of radio-amateur is so long that that issue is probably solved
> long ago.

The "issue" was solved long ago, you are totally wrong about EVERYTHING
you say, and amateur radio has NOTHING to do with the issue other than
you are posting in an amatuer radio group.

Post your nonsense in sci.physics.electromag and you will get exactly the
same response, you babbling idiot.

How many antennas have you built in your lifetime?

Not knowing anything about what the two of you are talking about, just
gotta say one thing... Engineers are known for knowing all the
knowladge to pass a test, yet not a single bit of real-world usage.
Eg. An engineer can design the complete working schematic for a ham
radio, but when it comes to putting it together, he may have the
hardest time stripping the wires, soldering the connections, etc. But
gosh darn it, once it's completely together, and fired up.... The
engineer would then listen carefully and hear a distorted sounding
voice and insist that the antenna wasn't working to full potential,
while the newly licensed short order cook steps up and turns the
clarifier slightly and hears a much clearer voice, then tells the
Engineer "You go tune the antenna, while I make a connection to this
operator!"

Most engineers are not technicians though a lot were a one time.

Do doctors usually know the best way to mop the floors in the hospital?

"A dipole antenna is a radio antenna that can be made of a simple wire, with a center-fed driven element. It consists of two metal conductors of rod or wire, oriented parallel and collinear with each other (in line with each other), with a small space between them. "

As you see Your dipoles are mechanically symmetrical.
It can works as the monopole or as the dipole. It depends on electrical connections.

Antenna with the four legs is used for the circullar polarization.

Tell us if the your dipole (the two legs and coax directly to a dipole)
radiate the polarised waves?

It seems you are using theories that apply to DC electronics (like
"it is connected to ground so it has zero voltage") to HF.

This is wrong. Even when you feed a dipole with a coax, there still
is almost symmetrical voltage on the two connections, even though the
braid is connected to one pole and the other end of the braid may be
grounded.
The result is that there is voltage on the outside of the braid, the
coax becomes part of the antenna and the radiation pattern changes.

But it will not be a monopole. If anything, it is a tripole.

Of course, nobody in their right mind would to that. Use a balun.

No. A monopole needs many radials, not one. if it has only one radial
the voltage at the end of the radial is the same as on the monopole,
and the whole thing becomes a dipole.

I think we need to avoid Szczepan's black and white (and usually
completely wrong) way of thinking about things. We need to consider
"When does a monopole become a dipole" (or vice versa).

With no actually ground connection, you could have a nominal monopole
with (say) only one radial (eg an extremely badly radiating quarterwave
radial running horizontally at ground level, and a quarterwave radiating
element going vertically (or semi-vertically) upwards. If you then raise
the radial so that it starts to radiate better - or if you raise the
whole antenna system away from the ground - it will then increasingly
become a dipole.

Of course, while a monopole with a single ground-level radial (and no
ground connection) would work quite well, it would not be as good as if
you added more (preferably spread out) radials. And the more radials you
add - especially if any overall radiation from the radials is negligible
- makes the antenna system more definitely a monopole than a dipole.

Good morning Szczepan.
There's a few problems in your quote:
1. it is unattributed
2. it doesn't mention ham radio
3. you, not the quote, have assumed a mechanical symmetry
4. the quote describes (with an obvious and important omission) the
mechanical construction of a dipole. It doesn't describe the electrical
design of a dipole.
5. there's an implicit contradiction within the quote.

Kindest regards, Ian.

I have found that in Polish description the dipole used by radio-amateurs
consists of the radiator and the counterpoise.
It is explained that it is geometrically symmetric.

Does anybody use the real dipole?

"balun definition
electronics
A transformer connected between a balanced source or load and an unbalanced
source or load. A balanced line has two conductors, with equal currents in
opposite directions. The unbalanced line has just one conductor; the current
in it returns via a common ground or earth path. "

The braid of the coax and the radial are connected. They work as the ground
(or counterpoise).

Is the voltage the same as in the live conductor (at the feed points)?

The type of transmission line used to feed an antenna has absolutely
nothing to do with what a particular antenna is or how the antenna
radiates.

You keep using the phrase "your dipole", which is utter nonsense.

A dipole is a dipole is a dipole.

A dipole will radiate circular polarization if it is not absolutely staight.

Wrong.

You keep using the phrase "your dipole" which is utter nonsense.

A dipole is a dipole is a dipole.

An antenna with two elements at right angles to each other is called a
V dipole and presents a balance load at it's terminals.

>>> And what if somebody have the monopole with the radials?
>>
>> Since a monopole with radials is an unbalanced load, there is no current

No, it is not; see above idiot.

A monopole with radials presents an unbalanced load at it's terminals
while two elements at right angles to eash other present a balanced load
at it's terminals.

Also, the patterns of the two antennas are totally different.

>>> The twin feeder ensure the electrical symmetry.

True

> The braid of the coax and the radial are connected. They work as the ground
> (or counterpoise).

No. There is no radial. There are two poles in a dipole and neither
of them is connected to the braid. It may be that one of them is
connected to the coax center conductor but this depends on the construction
of the balun (and the transformation ratio).

> Is the voltage the same as in the live conductor (at the feed points)?

Normally not, in a 1:1 balun.

>radio, but when it comes to putting it together, he may have the
>hardest time stripping the wires, soldering the connections, etc.

Nope. These daze, engineers do all their design work on a computah.
The design process is called direct to manufacturer. There is no hand
built prototype stage. They don't need to strip wires or solder
anything. Worst case is they might use a hot air SMT rework station
to replace a part, or fix a layout error. If it doesn't work right,
the engineer goes back to the computah simulations, fixes it, and has
the prototype shop robots build another revision. These are todays
engineers, not the cave man variety (like me) that had to build their
own prototypes, strip their own wires, and steal parts from production
to build prototypes. Those days are long gone, except maybe in garage
operations. Open a cell phone and tell my you can build it by hand
with your soldering iron and wire stripper.

>But
>gosh darn it, once it's completely together, and fired up.... The
>engineer would then listen carefully and hear a distorted sounding
>voice and insist that the antenna wasn't working to full potential,

Baloney. It's the marketing and sales guys that evaluate how
something sounds. Engineers use test equipment that measure how it
sounds, how well it works, and whether it complies with a multitude of
specifications. The numbers are far more sensitive to anomalies than
a talk test. On a rare day, there may actually be a talk test, but
that's unusual. Incidentally, you can see distortion on a scope long
before you can hear it.

>while the newly licensed short order cook steps up and turns the

It is always a dipole no matter where it is.

The type of antenna is determined by it's geometry, not it's location
or it's transmission line.

It is the radiation pattern of the antenna that is effected by it's
location.

If that is true, then that description is essentially wrong. Maybe it is
a translation problem?

>It is explained that it is geometrically symmetric.

That is essentially true. However, what happens if the symmetry is not
quite absolutely perfect? When does it cease to be a dipole?
>
>Does anybody use the real dipole?

I doubt if many who use an antenna which has a radiator and a
counterpoise would think of it as a dipole. However, as I have
suggested, it is all a matter of degree, ie how much radiation comes
from the 'counterpoise'. A counterpoise is really intended to provide an
artificial ground - especially in conditions where it difficult to get a
good ground connection, or where the conductivity of the ground is poor.
Usually, the intention is that a counterpoise does not (or does not need
to) radiate. Multiple counterpoises are effectively radials, which are
definitely not intended to radiate.

If a dipole is fed directly using coax - but without a balun, the
'counterpoise' side of the dipole (the side connected to the coax
screen) radiates considerably. Also, a lot of the current in the
'counterpoise' side flows on the outside of the coax. This means that
the coax itself radiates (even if it perfectly grounded at the
transmitter end). Depending on the particular situation, this may - or
may not - cause problems. To prevent the possibility of problems caused
by radiation from the coax, a balun should be used.

The your Polish radio amateurs would be idiots or your understanding of
Polish is just as bad as your understanding of English.

> It is explained that it is geometrically symmetric.

Likely about the ONLY thing you have said that is both true and relevant.

> Does anybody use the real dipole?

The dipole is likely the most common type of antenna in use at frequencies
above about 2 MHz, so yes, thousands and thousand of people and organizatons
use dipoles.

How many antennas have you built and used?

The fields, currents, and voltages on an antenna can not be measuered by
paper and pensil (sic) and the methods necessary to calculated their
values didn't exist until Faraday was long dead and only became practical
after computers were invented.

Not quite correct, but close enough.

> (or counterpoise).

OK.

> Is the voltage the same as in the live conductor (at the feed points)?

Gibberish.

What is a "live conductor"?

Correct.

> A balanced line has two conductors, with equal currents in
>opposite directions.

Correct.

>The unbalanced line has just one conductor; the current
>in it returns via a common ground or earth path. "
>
Incorrect.

Unbalanced line (ie coax) has two conductors - the inner conductor and the screen. At RF, the go and return currents flow on the outside if the inner conductor, and on the inside of the screen. The outside of the screen should be 'RF dead'. However, when the unbalanced coax is connected directly to a balanced antenna, a lot of the screen current flows on the outside of the screen, so the coax becomes part of the antenna, and radiates.

>The braid of the coax and the radial are connected. They work as the ground
>(or counterpoise).
>
A counterpoise (or a system of radials) can provide an artificial ground. However, an artificial ground is only required for 'one-sided' monopole types of antennas. A counterpoise is not normally intended to be a radiator.

The 'counterpoise' side of a dipole - if it is connected directly to the coax screen - is not RF-dead. It is usually intended to radiate more-or-less as well as the 'RF-live' side. Unfortunately, some of the current in the 'counterpoise' side of the dipole flows down the outside of the coax screen, and this causes the coax to radiate.

>Is the voltage the same as in the live conductor (at the feed points)?

Which voltages do you mean?

1783. common mode current

Newsgroup: rec.radio.amateur.antenna
Date: 2012-07-10 16:49:52 UTC
From: Szczepan Bialek <sz.bialek@wp.pl>
Message-ID: <4ffc5d2e$0$1231$65785112@news.neostrada.pl>
Source record: 1450

"The current which flows on the outer surface of the shield is called common mode current. In other words, it is the unbalanced current not returned within the coaxial cable.
This leads to a very important question. If the current isn't returned in the cable, where does it go? The answer is, it radiates! In fact, the amount of radiation from the coax cable is directly proportional to the common-mode current on that cable." From: http://www.k0bg.com/common.html

"In fact, the amount of radiation from the coax cable is directly proportional to the common-mode current on that cable."

The currents consists of electrons.

Does it means that the electrons jump off from the end of the radiator?

In Faraday time no such meters but Faraday had know that electrons (nuclei) jump off from the end of the open circuit.

Also L. Lorenz known that the light is the oscillatory flow of electrons.

S*

No, it does not mean that.

There are no jumping electrons involved in radiation and you are an ineducable
idiot.

>
> In Faraday time no such meters but Faraday had know that electrons (nuclei)
> jump off from the end of the open circuit.

No, Faraday did NOT know that as it doesn't happen that way and you are
an ineducable idiot.

> Also L. Lorenz known that the light is the oscillatory flow of electrons.

No, Lorenz did NOT know that as it doesn't happen that way and you are
an ineducable idiot.

Me too but I know what it is; the insulation from the cheap Home Depot house
wire I used to make the antenna.

The damn insulation is hard to strip off when it is new but falls off all
by itself after a couple of years in the sun.

Maybe the insulation is falling off because of all the electrons that
have tried to jump off the wire when you were transmitting, and became
trapped inside the insulation?

Unless you were in a very small operation or talking about REALLY ancient
times, engineers as a general rule never did mundane tasks.

Those were left to other, lesser paid people, like technicians, draftsmen,
and typists.

No one in their right mind would pay an engineer to build and test a
prototype, draw up the formal schematics, or type up the documentation
when there are other people who could do that faster and at a much lower
hourly rate.

Most of the places I worked, the testing was done by techicians who
wrote up a test results report for the engineers and the engineers
only got involved if something was hinky in the test results.

Sorry, electrons cannot move fast enough to support RF current which cannot flow inside a wire. The RF EM wave flow is supported by photons moving at the speed of light in a cloud surrounding the wire.

> Does it means that the electrons jump off from the end of the radiator?

Electrons are known to "jump off from the end of the radiator". It's called corona and it is visible at night. Fortunately, it happens only under special conditions because that energy is not coherently radiated, i.e. not useful for anything except melting the ends of an antenna.

> In Faraday time no such meters but Faraday had know that electrons (nuclei)
> jump off from the end of the open circuit.

Yes, arcing is a common occurrence. Unfortunately, nowadays it is useless (and illegal) for RF communications. BTW, nuclei is plural for nucleus and there are no electrons in the nucleus.

Your antennas are the diwire.
From the radiating wire the electrons jump off and penetrate into the
counterpoise wire.
It would be interesting to know if is any difference in behavior of the
different wires.

From experience we all know that there is no difference between te
behaviour of insulated or blank wires when used as an antenna. We use
what is convenient.
This sort of contradicts your claim that electrons jump off the wire,
as this would not work as well with an insulated wire as with a blank
wire.

Hello Szczepan.
"Diwire"? What's that?
"From the radiating wire the electrons jump off and penetrate into the
counterpoise wire."
Sounds like a rather short circuit. Not much chance of a QSO.

Regards, Ian.

In Faraday time no nucleus. Now the Faradays nuclei have name electrons.
Maxwell name is "electric particles".
All of them are in space. The last names are "Dirac electron sea" and the
"rare plasma".

Hello Szczepan.
I am a tad concerned that atoms in Mr Faraday's time didn't have the
nucleus. I wonder when the nucleus was added to the atom, who added it and
how much power was needed for this nuclear (fusion?) work.

I think we may be wearing out Mr Bialek's circuits. A lack of electrons,
perhaps? Didn't he have problems with insulators which didn't insulate.

May I suggest a new newsgroup for these postings? Something along the line
of rec.radio.amateur.humour ?

73, Ian.

What do you mean by "Your antennas"?

An antenna is an antenna, there is no yours, mine, and theirs.

What is "diwire"; there is no such word in English?

If you are trying to babble about the construction material of and anteena,
the material used only effects the ohmic losses of the antenna.

> From the radiating wire the electrons jump off and penetrate into the
> counterpoise wire.

There are no electrons jumping anywhere.

You are an ignorant, babbling, ineducable, idiot.

> different wires.

It would be interesting to know if you will EVER be able to understand
anything.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong?

In English the Ham dipole is the same as the two wires where one is
connected to the live conductor and the second to the bride.
In Polish the Ham dipole consist of the radiator and counterpoise.
So the correct name for such aerial is "diwire".

> "From the radiating wire the electrons jump off and penetrate into the
> counterpoise wire."
> Sounds like a rather short circuit. Not much chance of a QSO.

From Maxwell time all circuits are closed (displacemment current).
See at that: http://educypedia.karadimov.info/library/Dipolentstehung.gif

The short circuit would be if the radiator and the counterpoise are close to
itself.
They are in such cofiguration in the transmitting line.
Have you QSO with the line alone?

As you know the insulators do not stop the "oscillatory flow of electrons"
(radio waves) at your frequency.

But you can order in NASA proper insulator.

Each area has their own language.
Simply same of you do not know that "dipole" is a radiator and counterpoise.

So you are right that the "dipole" do not need the ground.
Do not need, because the ground (counterpoise) is the integral part of the
"dipole".

In summary Marconi is right.

Hello Szczepan.
Oh dear! A dipole is a dipole regardless of the country in which it is used, be it the UK, the USA or Poland. Seems that you still do not understand a dipole.

If you want to believe that radio hasn't progressed since the days of Marconi then that is fine by me. You'll be wrong but I can live with that.

Regards, Ian.

I remember well that in the past the domain nasa.com was in use by
some mail order store. I don't know if that store still exists, it
seems difficult to find any details about it. The nasa.com domain
now appears to be in the hands of a cybersquatter.

(of course the domain for the National Aeronautics and Space Administration
is nasa.gov, but I doubt you can order insulators there)

As a general rule, US government agencies are forbidden by law from selling
"stuff" and particularly fobidden from selling anything commercially
available.

>hourly rate.

True for most companies, but not true for every place that I've worked. One such small company made it a point of having the engineer personally perform every step of the production cycle from incoming inspection to shipping. At some point, I did incoming inspection (QA), parts stuffing, wave soldering, lead trimming, final assembly, cable harnesses, production test, QA test, burn-in setup, and shipping. There was no attempt utilize expensive engineering talent for these jobs. It was a very necessary learning experience that paid off handsomely in improved efficiency. It's one thing to stand aside and just watch someone do their job. It's quite another to actually sit down and do it. For example, we had a small 3 turn coil that was hand wound on a form. Production people could average about 5 coils per hour, which stunk. I sat down for several hours, made numerous changes, found numerous problems that nobody bothered to identify, and was able to crank out about 40 coils per hour. However, my fingers felt like they were going to fall off after about an hour. This wasn't going to work. The experience was sufficient to justify the design and construction of an automatic coil winder, that could do about 200 coils per hour.

When I worked for larger companies, I did much the same thing. I experienced some initial resistance but got the attention of production by breaking a few rules, but which dramatically improved efficiency. I arranged to have the drawings and assembly instructions translated into several languages. While assemblers were expected to know English, they were not proficient in technical English. From then on, the suggestions and changes came quickly. Unfortunately, I still had products to finish, but was allowed about 25% of my time to do the production engineering function.

An engineer (or manager) that sits behind a computer, never leaves the office, never sits on the production line, never understands how

things are built, and never has an understanding of anyone elses job, will eventually make some rather nasty mistakes. Using engineering talent for these functions is not a good idea for extended periods, but is a good idea for the short periods needed to gain the necessary experience.

Incidentally, in the distant past, one of my consulting jobs was cleaning up the computerized RF board layouts produced by an assortment of PCB designers, that didn't seem to understand that RF travels in roughly straight lines, and that bypassing requires a low impedance ground, not a mass of spaghetti wiring.

>Most of the places I worked, the testing was done by techicians who
>wrote up a test results report for the engineers and the engineers
>only got involved if something was hinky in the test results.

Likewise. Unfortunately, production test was reluctant to call engineering for help because we would tend to be rather disruptive. When I had to fix things using paper reports (usually incoherent) and ECO's (engineering change orders), it took much longer and many tries to fix it correctly. When I sat down and saw the problem for myself, it was usually fixed the first time, and usually without attendant piles of paper going in both directions. I couldn't do much of that at larger companies, but when I was asked for an overnight solution, that was the only way.

Hello chaps.
Szczepan thinks that "NASA" is a store, like Radio Shack. He may be the sort of person who thinks that the Bank Of England is an ordinary commercial bank (I get spam purporting to be from the Bank Of England and asking me to verify my account).
I also suspect that Szczepan is happy to sit at a keyboard, type some nonsense and watch how we respond.
I'll happily help anyone who is willing to listen/read and learn but Szczepan clearly is not capable of, or does not wish to learn. I could also take his odd views as being indicative of someone "not quite with it". There are other things which can be inferred ... but not on a public newsgroup.

73, Ian.

I call bullshit. You can order lots of things at the National Aeronautics
and Space Administration. It is primarily promo material.

As I keep saying, I'm convinced that Szczepan is thinking of a situation
where a dipole fed directly with coax. He may have seen diagrams which
show this, and they have become fixed in his mind.

Then, because the coax is (usually) grounded at the TX end, he believes
that the leg of the dipole, which is connected to the coax screen, is
also grounded - and therefore it serves the function of a counterpoise -
like you might use in a situation where the antenna is a directly-fed
end-fed wire situations, and it is not possible to get a good ground
connection.

In a way, Szczepan is sort of right. Consider the situation where a
dipole (no balun) is connected to the TX via essentially zero length
coax, and the TX chassis is not well grounded. [For example, possibly
there is a physical safety ground connection, but it is too long to be
effective at RF.] The 'ground' side of the of the dipole would indeed
function as a counterpoise, which might - or might not - radiate
effectively (depending on its height, its physical relationship relative
to the 'live' leg etc).

Now increase the length of the coax. At some stage, we would no longer
consider the 'ground' leg as a counterpoise, and think of it simply as
the other leg of the (directly connected) dipole.

However, while Szczepan may have a point if he is thinking of a
directly-connected dipole, he is obviously talking total nonsense if he
is referring to a dipole fed via a balun, or from a balanced tuner via
twin feeder. I fear that he is incapable of taking a rational, lateral
view of things, and therefore will continue to repeat his essentially
incorrect mantra.

There was a bird on my antenna wire. I think he may have crapped about
the time I was looking. It was either that or a huge bunch of electrons
all fell off at once.

Michael

I prefer to think of the do-do. Keeping birds off aerials could be a
rewarding topic. I think the pigeons that perch on my HF beam nibble at the
trap end caps. Not good news.

Hey it is not all babble. I had my bride hold one end of my dipole once for a quick check of SWR. It sounds as if I would get out a lot better if I had her up there holding one end all the time. The bad news is that she said she was not going to help me any more with climbing trees and fastening my antennas. She has done this for me for 50 years and now suddenly she gets cold feet at going up in a little 90 foot fir tree. What they say is true, "nothing good lasts forever".

She helps with antenna construction but will not climb a tree. I don't know if this is legal grounds for divorce in Michigan. If it is, I could show her the statute and ask her again about that 90 foot tree I want her to climb. She started climbing trees for my antennas when she was 11 years old. How could she stop now????

Michael

Hello Michael. Over here, in the old country, we attach the wire to a
sapling and we wait. We're good at waiting. As the sapling grows we pay out
a little more wire. Eventually, we have our wire at the height we want.
Caution - if your bride offers to climb a tree for you, do not let her carry
anything heavy.
Stay away from the tree. Wear a hard hat. Tell her that your life insurance
does not pay out for injury or death due to falling objects (for falling
objects are due to gravity and that's an act of nature).

73, Ian.
ps. It has been unduly sunny over here to-day. The sun affects we Brits as
we don't see it very often. In fact, it's probably easier here in Britain to
see an electron shoot past than to see the sun.

Ian, I am pretty advanced in years. I am 69. I can remember a comedian
whose name escapes me. He got paid good money for coming on stage and
talking just like Szczepan. I think it would be a gas for him to address
a large gathering of amateur radio operators. He could have us all in
stitches in a few seconds.

I get a fair amount of entertainment value just reading his posts. Some
of them are laugh out loud moments for me. I don't know whether his is

truly that ignorant or is just having fun with us. It doesn't matter. He is funny.

BTW Szczepan, I have a loop antenna for low band. The electrons go around in a circle and I recycle them. This saves a huge amount on my electric bill.

Michael

What part of "general rule" and "commercially available" do I need to
explain to you in minute detail?

How commercially available is promo material for NASA?

Can I get it at Walmart?
```

Hello Michael. From where I am sitting, 69 isn't all that old. I have
friends heading for 90 who are definitely not showing their age.
Was the comedian a Brit named Stanley Unwin or an American named Fred ???

That does not change a dipole into anything other than a dipole.

Feeding an antenna with any transmission line ill suited for the antenna
will of course lead to unwanted currents which will radiate to some
degree.

However, the antenna is defined by the geometry of the antenna and the
transmission line does not change the radiation of the antenna unless
you are doing something really stupid like taping the transmission line
to one of the elements of the antenna, which changes the antenna

geometry.

Feeding an unbalanced load such as a ground plane with balanced line
will also lead to unwanted currents which will radiate to some degree,
but the ground plane antenna is still a ground plane antenna.

It appears to me that someone has been reading too many Wikipedia
articles - especially the ones that I wrote a long time ago.
Not to mention too many old editions of S9 and CQ magazine.

In the mid 60's - we talked about Tower Lighting - where the energy
emitted from the antenna was being asorbed and reflected and radiated by
the tower - which technicially was being electrostatically charged.

This was also the reason why HY Gain came up with the little egg beater
/ colineariator on top of their vertical antenna's such as the Super
Magnum 117..

I think someone forgot to give Sheldon his medications today and he has
gotten a little out of hand and the other techo geeks on this forum
decided to attack.

Would everyone please take a chill pill and just calm down and relax.

I'm sure you can display your Pedant knowledge to someone a little less
bright then you, say maybe the check out girl at the grocery store or
the guy that pumps your gasoline into your vehicle at the gas station.

Dear Neighbor,

Something important:

While going through some files, we've been fortunate to have

the opportunity to review some of our customers' old insurance policies.

Here's what we discovered: Over the past few years, many insurance

rates have actually gone down.

· More types of insurance are available
You can get specific coverage - insuring just

what you need - which provides a lower rate.

· More deductibles are now available

Smart options in deductibles can save you plenty!

· More options in coverage amounts are available

Get rid of excessive coverages and save even more!

· Additional Savings are available for meeting specific requirements

For example, if you're a good driver, we have added bonus

savings for you with our good driver rates.

· You can often lower your premiums with broader coverage

Everyone wants your business. When you place more insurance,

(car, home, life, business) your overall premiums

can go down.

We've made a lot of friends - by saving people money. Here's

what we'd like to do for you: While we can't guarantee every client

will save money, the chances are great that we'll SAVE YOU MONEY.

Please see my website http://insuranceinformationtoall.blogspot.com

reviewed in a while.

thinking of it!

Thank you.

Kindest regards,
http://insuranceinformationtoall.blogspot.com

Dear Neighbor,

Something important:

While going through some files, we've been fortunate to have

the opportunity to review some of our customers' old insurance policies.

Here's what we discovered: Over the past few years, many insurance

rates have actually gone down.

· More types of insurance are available
You can get specific coverage - insuring just

what you need - which provides a lower rate.

· More deductibles are now available

Smart options in deductibles can save you plenty!

· More options in coverage amounts are available

Get rid of excessive coverages and save even more!

· Additional Savings are available for meeting specific requirements

For example, if you're a good driver, we have added bonus

savings for you with our good driver rates.

· You can often lower your premiums with broader coverage

Everyone wants your business. When you place more insurance,

(car, home, life, business) your overall premiums

can go down.

We've made a lot of friends - by saving people money. Here's

what we'd like to do for you: While we can't guarantee every client

will save money, the chances are great that we'll SAVE YOU MONEY.

Please see my website http://insuranceinformationtoall.blogspot.com

reviewed in a while.

thinking of it!

Thank you.

Kindest regards,
http://insuranceinformationtoall.blogspot.com

It is not true for every R&D place.

There no "draw up the formal schematics, or type up the documentation"

The each prototype is simmillar to something older.
The R&D people take the copy of the simmillar documentation and change the
identification number and dimensions, materials etc..
The new prototype documentation is ready in a few hours.

It is obvious that you was working in R&D places.

If a prototype is a succes then the formal documentation is made by another
staff.

"I prefer to feed them directly with coax at a corner and situated in a
diamond configuration when hung verticle but, you can feed them in the
center of either side.
"A little known fact is that you can add a half wavelength of wire behind
the loop instead of the closed loop. This comes in handy where supports are
not abundant."

From: http://ku4ay.net/loop.html

The electrons oscillate in the loop and collide in the nodes.

In that places the voltage is doubled and the electrons jump off.

Somebody wrote here that the current radiate.

In all AC circuits the same current if flowing in the live conductor and in
the ground (return).

Can 0V radiate?

That is why it only radiates when the currents do not flow in the
opposite direction!

So, a balanced feeder line with two parallel wires carrying the HF current
(in opposite directions) does not radiate.

But in a dipole antenna, the currents in the two wires do flow in the
same direction. So a dipole radiates.

Wrong. I worked for several manufacturers as an employee and as a
consultant. There was no R&D and I have never done any R&D.

>If a prototype is a succes then the formal documentation is made by another
>staff.

I never produced any formal documentation at any company. I did what
was needed to get a product into production and occasionally to
scribble something for trade journals and advertising.

The prototype and documentation were a parallel effort in order to
save time. It was quite common to do the prototype in stages, with
sections of the design being frozen before the final product had been
tested. This allowed some of the documentation to be completed before
the prototype was completed.

The closest approximation of something formal were two radio direction
finders for the US Coast Guard. The documentation was done by a
professional tech manual writer. I wrote most of the raw text and
sketched some of the drawings.

Sorry, there are two currents, forward and reflected, flowing in opposite directions on a standing wave antenna. A 1/2WL dipole is a standing wave antenna where the SWR at the ends is infinite and the SWR at the feedpoint is ~20:1. There is forward and reflected wave energy flow on each element of the dipole. At the ends of the 1/2WL dipole the forward and reflected currents are 180 degrees out of phase and equal in magnitude so they phasor add to zero, i.e. a standing wave current minimum (null). Since the forward and reflected current phasors rotate in opposite directions, they are in phase at the feedpoint and phasor add (constructively interfere) to a standing wave current maximum (loop) and most of the radiation is from the center of the antenna.

The feedpoint impedance of a dipole is Zfp = (Vfor+Vref)/(Ifor+Iref) phasor math.

More utter nonsense.

> It is obvious that you was working in R&D places.

No, to someone that actually knows something, it is obvious he was mostly
working in places that manufactured products.

> If a prototype is a succes then the formal documentation is made by another
> staff.

Formal documentation is usually produced by a tech writter with inputs from
engineering and marketing.

Well, now we have another subject that you know absolutely nothing about
and just babble nonsense.

You really are a babbling, ignorant, ineducable, idiot.

Electrons don't collide; you are a babbling idiot.

> In that places the voltage is doubled and the electrons jump off.

Electrons don't jump off; you are a babbling idiot.

> Somebody wrote here that the current radiate.

Nobody here wrote that; you are a babbling idiot.

> In all AC circuits the same current if flowing in the live conductor and in
> the ground (return).

Utter, meaningless, babble.

> Can 0V radiate?

Voltages don't radiate; you are a babbling idiot.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all
the people that have successfully built hundreds that they are all wrong
and you don't want to admit you are an ignorant, inducable, idiot?

Stanley Unwin's your man. Before he became a comedian, he was a BBC
transmitter engineer, so he was one of us...

http://www.stanleyunwin.com/home2.htm

By us, of course, I don't include Szczepan. My feeing is that he's
either :

1 Far gone with senile dementia OR
2 An academic troll who's been winding up Usenet groups for years

I think (2) is more likely - dementia is progressive, and I'd expect
Szczepan's ramblings to get gradually more and more incoherent. Instead
there is a strangely consistent quality to them.

Anyway, I killfiled him years ago.

No, they don't.

You read some generalized statement about something from somewhere, then
leap to the conclusion that the statement is always true everywhere.

You read that a ground mounted, end fed monopole requires a ground, so you
leap to the conclusion that all antennas require a ground.

You read that an end fed monopole requires a counterpoise of some kind,
so you leap to the conclusion that all antennas require a counterpoise.

You read that some companies have R&D centers, so you leap to the conclusion
that all companies have R&D centers.

You are a stupid, ignorant, babbling, ineducable, idiot.

> I am here to learn. To learn English.

Learn this English; you are a stupid, ignorant, argumentative, babbling,
ineducable idiot.

If you really want to learn English, read newspapers, magazines, and watch
TV and movies in English.

> I do my best.

I would hate to see what your less than best is.

> But I do not understand why in your antennas no electrons.

That is because you are a stupid, ignorant, argumentative, babbling,
ineducable idiot than instead of listening and learning argues with people
with hundreds of years of combined experience.

You also refuse to read, and reread until you really understand it, any
modern material on electromagnetics, whether from Wiki or University
level textbooks, in ANY language.

You are a joke and a laughingstock.

Hello chaps.

Regardless of the reason for his postings, Szczepan is good for a laugh (and
I don't mean that in a nasty way) and the occasional good discussion amongst
those of us who care to think about radio and electronics.
Anyone else notice that his command of English varies from posting to
posting?

73, Ian.

If your were to read, and reread until you really understand it, any modern
material on electromagnetics, you would then know what role electons play
in electromagnetics and electromagnetic fields.

Yes, electrons are involved in electromagnetic fields, but no, electrons do
NOT jump off antenna elements.

Why are you incapable of getting a University level textbook, in any
language, on electromagnetics and reading it?

Looking at his posts from years ago, I don't see a lot of difference.

It appears his ability to learn English is just as bad as his ability
to learn anything else.

He is ineducable.

Hello chaps.
Michael - thank you for the link to Irwin Corey. I've not heard of him at all so I will spend some time watching the videos on his web site.
Best wishes to all for a good weekend. If you're coming to the UK for the Olympics then I suggest some decent waterproof clothing.

Some 110 responses have been made to the fellow who may, or may not, be in Poland. This does not count a similar number of messages from the fellow, as those are blocked.

Why, oh why, do you continue to be the mechanics described so well by Mr. O'Nella?

Stop feeding the fellow. 73, Mac N8TT

"Sal M. O'Nella" wrote in message news:jta8dc$3is$1@dont-email.me...

Which is why I made my reference to Allen Funt of "Candid Camera." Funt created preposterous situations and yet people tried their darndest to make something real out of it.

I recall a car with no engine whose driver rolled it downhill into a service station. The driver, Funt's attractive co-host, insisted that she had driven around town all day and wanted the mechanic to check the car because it didn't seem to have much power. In a perfect world, when the mechanic popped the hood, he would have laughed and the "bit" would be spoiled. But no! He tried eight ways to explain to her that she COULDN'T have been driving around town. She just sweetly continued the hoax as several other mechanics came over to check out the action. Classic!

Szczepan is that car with no engine and we are those mechanics. :-)

" modern material on electromagnetics," is wrote by Heaviside"

"I remember my first look at the great treatise of Maxwell's when I was a
young man... I saw that it was great, greater and greatest, with prodigious
possibilities in its power... I was determined to master the book and set to
work. I was very ignorant. I had no knowledge of mathematical analysis
(having learned only school algebra and trigonometry which I had largely
forgotten) and thus my work was laid out for me. It took me several years
before I could understand as much as I possibly could. Then I set Maxwell
aside and followed my own course. And I progressed much more quickly... It

will be understood that I preach the gospel according to my interpretation
of Maxwell.[4] From: https://en.wikipedia.org/wiki/Oliver_Heaviside

His "own course" is without the "electric particles". In Maxwell model were
such.
What "role electons play" in antennas (not in fields)?

Hello Mac.

As I've said before, it is fun and we do have some interesting discussions amongst ourselves about aerials. I've a feeling that Szczepan is looking for the engine and we're telling him that he is looking at a trolley and not a car. Please don't push the analogy too far; some of us may say that we rolled the car downhill and Szczepan can't understand that gravity moved the car so an engine wasn't needed at all.

73 Ian.

You should forgive Maxwell's ignorance and join us in the 21st century. Free electrons act as a "bucket brigade" for the coherent photons which make up the quantized fields/waves surrounding the antenna conductor. If Maxwell were alive today, he would have rewritten his works to correct his ignorant mistakes. Would you still be studying his obsolete works or his new corrected works?

MODERN texts use the Biot-Savart law.
"1825 - Ampere publishes his collected results on magnetism. His
expression for the magnetic field produced by a small segment of current is
different from that which follows naturally from the Biot-Savart law by an
additive term which integrates to zero around closed circuit. It is
unfortunate that electrodynamics and relativity decide in favor of Biot and
Savart rather than for the much more sophisticated Ampere, whose memoir
contains both mathematical analysis and experimentation, artfully blended
together. In this memoir are given some special instances of the result we
now call Stokes theorem or as we usually write it. Maxwell describes this
work as ``one of the most brilliant achievements in science. The whole,
theory and experiment, seems as if it had leaped, full-grown and full-armed,
from the brain of the `Newton of electricity'. It is perfect in form and
unassailable in accuracy; and it is summed up in a formula from which all
the phenomena may be deduced, and which must always remain the cardinal
formula of electrodynamics.''

Electromagnetics is a piece to teach (for children).

For adults are electrodynamics. In a current University level textbook are
many chapters.
The fields are only a math tool. Completly useless for electrons.

Don't forget, this stunt was done later with a much more effective punch
line. They installed an electric motor in the rear and had batteries in
the trunk. She would hear that her engine could not be fixed because it
was missing. She would get mad and tell them she was not going to be
tricked into unnecessary repairs.

The punch line was when she rolled away and the hidden camera recorded
the looks on the faces of the mechanics.

You babbling, ignorant, stupid, ineducable, idiot, Biot-Savart applies
to magnetostatics, which has NOTHING to do with how antennas work.

Jefimenko's equations are the basis of modern electromagnetic field analysis.

Jefimenko's equations first appeared in print in 1962.

<snip qoute from 187 years ago>

OK Gentlemen: I am now more wise. Entertainment comes in multiple forms.

A question that is indirectly related to antennas: I was explaining to an attorney how the common North American 60 Hz electrical system is configured for residences (240 VAC, center taped secondary, with the neutral connected to earth and to the green wire [only] at the service entrance) He observed that in the UK he was told that schemes for supplying 240 VAC 50 Hz had earthling being done, if at all, several different ways.

So, educate us please: when we travel to the UK what are the schemes we will find. I always used an isolation transformer that was only connected while equipment was being used.

In a similar manner to what several of you have observed about yourselves, I too have had a fascination with antennas (RF type, not 60 Hz) for close to 60 years. W8JK's 1950 book was a life changer - as I expect it was for many.

"Jackson characterizes the equations as "Jefimenko's generalization of the
Coulomb and Biot-Savart Laws".

Heaviside and Jefimenko assumed that: "That a moving charge is equivalent to
an electric current-element is undoubted, and to call it a
convection-current. as Prof. S. P. Thompson does, seems reasonable." From:
https://en.wikisource.org/wiki/Electromagnetic_effects_of_a_moving_charge

It is not reasonable. In current are many charges (electrons). No
experimental evidences what the magnetic field is in the case of the one
charge.

The reasonable aproach is the Faraday's:
" Whatever the view adopted respecting them may be, we can, at all events,
affect these lines of force in a manner which may be conceived as partaking
of the nature of a shake or lateral vibration. For suppose two bodies, A B,
distant from each other and under mutual action, and therefore connected by
lines of force, and let us fix our attention upon one resultant of force,
having an invariable direction as regards space; if one of the bodies move
in the least degree right or left, or if its power be shifted for a moment
within the mass (neither of these cases being difficult to realise if A and
B be either electric or magnetic bodies), then an effect equivalent to a
lateral disturbance will take place in the resultant upon which we are
fixing our attention; for, either it will increase in force whilst the
neighboring results are diminishing, or it will fall in force as they are
increasing."

Here the oscillating charge causes the lateral disturbances.
In Biot-Savart are the rotational disturbances.

Dear Jeff: Many thanks.

It is especially interesting to learn that the expectation of encountering a floating (no earthing) system is zero.

Expanding a bit on what you have communicated:
It appears that the transformer used between one phase of a HV 3 phase line and distribution "wires" is 440VAC, center tapped. The distribution "wires" to a house (or the like) are one side of the aforementioned transformer's secondary and the transformer's center tap, which is labeled as neutral. It is expected that another house (or the like) is fed from the other side of the transformer's secondary and its center tap.

At the service entrance: one scheme connects the neutral to an earthing. An alternative (called 'protective multiple earthing' (PME)) does not connect the neutral to an earthing, but connects exposed metal in the house to an earthing. Wow! The latter scheme is expected in new construction.

It is not immediately clear what the advantage of the PME scheme might be. Your caution about RF grounds is well placed.

In the North American scheme, for the last 60 or more years, a third wire is involved - the green wire that is connected to an earthing only at the service entrance and then to touchable surfaces of an appliance. The green wire maintains what a human can touch at ground potential without relying on anything else. In sub distribution boxes, the green wire is isolated from neutral so the green wire provides a straight path for current to an earthing.

Please correct any errors that have crept into my restatement. I once had a G5 license and, in my radio astronomy days, spent a brief time at U. of Manchester.

Warm regards, Mac N8TT

This is not what a 3-phase system is. What you describe is a 2-phase system.

A 3-phase system has 3 live wires, a neutral, and possibly a ground.
The 3 phases are 120 degrees apart, not 180.
Each phase has a voltage (230V here), and there is sqrt-3 times that
voltage between the phase wires (400V here). All three phases are
used in some electrical motors and in highpower applications like
electrical heating, and one of the phases is sufficient for a normal
house connection.

> At the service entrance: one scheme connects the neutral to an earthing.

Why "Wow!" ?
It is the only safe system.

Here in the Netherlands we have the same situation. Power is distributed
over 4 wires (3 live phases plus neutral) and a 5th wire is locally
distributed for safety ground. It is connected to the safety ground
connections of all reeceptacles and to metal structures in the house,
like water and central heating pipes. The neutral is only connected
to ground at the substation, and usually has a couple of volts on it
when measured at the receptacles.

Irrelevant to the discussion and Heaviside did not fully understand
electromagnetic fields.

> It is not reasonable. In current are many charges (electrons). No

Yes, you ignorant moron, there is LOTS of evidence about the magnetic
field of individual charges, not the least of which is the operation
of the cathode ray tube, possibly known to you as a TV picture tube.

Biot-Savart applies magnetostatics, which has NOTHING to do with how
antennas work.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all
the people that have successfully built hundreds that they are all wrong
and you don't want to admit you are an ignorant, inducable, idiot?

Why do you refuse to read a university level textbook on electromagnetics?

Is it because you are too ignorant and stupid to understand the contents
in any language?

Dear Rob: Of course I know what a three phase system is. In North America, most high voltage (HV) is distributed using three phase. In a residential area, a transformer's primary is connected to one of the phases (with secondary producing what you call a 2-phase, 120VAC - 240VAC system). At the next house, or group of houses, down the road another transformer is connected to a different phase - and so on. Because the net power factor of a residential area is inductive, periodically one will see a platform on a pole holding three sets of capacitors each connected to a phase.

However, some businesses, farms, and essentially all industrial sites receive all three phases mostly to avail themselves of the certain torque and efficiency of three-phase-motors. [I told my students that the first rule of 3-phase is never to lock the shaft of a new motor until one verifies which way the shaft actually turns - because it will turn.]

It is most interesting to learn that in the Netherlands it is common to deliver three phase to a residence. That is a surprise. My dormitory at university distributed three phase with outlets on facing walls in some rooms being on a different phase. This facilitated fast heating of hot-dog sausages - not that I ever did such a thing. I have known about sqrt-of-3 for a very long time.

The use in the Netherlands of a fifth grounding wire - the green wire in North America - is truly a good idea.

The "Wow" is prompted by the less than belt-and-suspender nature of a house distribution system not using a green (earthing) wire. Steve pointed out that things can go wrong. The system you described being used in the Netherlands, while at 240 VAC, does not rely on all of the bonding staying effective - and that is good. It also has the advantage of being able to provide 3-phase to the few motors expected in a house.

Rob - many thanks for expanding my knowledge. Every engineer from the Netherlands with whom I have worked has impressed me most favorably. Can not say that for engineers from some countries.

Like in the UK, we don't have low and medium voltage power distribution
on poles.
All local distribution is underground. Only high voltage is distrubuted
(between cities) on overhead cables.

> It is most interesting to learn that in the Netherlands it is common to
> deliver three phase to a residence. That is a surprise.

It is common, but not everyone has it. However, it is the normal situation
to distribute 3-phase power to every residence and then connect only a
single phase to a meter, picking another phase at each residence. On
request, the connection can be upgraded to 3-phase by exchanging the
meter and adding two more fuses to the already present 3-fuse box.

Dear Rob: That is amazing. Very forward thinking. However, it seems to use a lot of copper, some of which is latent waiting to be used. On the other hand, the cost of running the 3 phase cable underground probably is much more than the cost of the cable.

In the North American scheme, most HV and LV cables are "in the air." This tends to minimize the cost of running the cable and, too often, advantage is taken of air-cooling to use what I believe to be wire that is too small. Some newer, crowded residential areas do bury everything. The wires to my house are buried both as a means to provide safety (antennas can not touch wires) and, because of the reduced cooling, as a means to have the right gauge of wire used. I had to pay extra to have the pole to house connection be as I think it should be.

Each of the disclosed systems has advantages and costs. It is fascinating to see how different systems value the costs.
Thank you for expanding my knowledge. One wonders if you are a radio amateur. 73, Mac N8TT

Like in the UK, we don't have low and medium voltage power distribution on poles.
All local distribution is underground. Only high voltage is distrubuted (between cities) on overhead cables.

> It is most interesting to learn that in the Netherlands it is common to
> deliver three phase to a residence. That is a surprise.

It is common, but not everyone has it. However, it is the normal situation to distribute 3-phase power to every residence and then connect only a single phase to a meter, picking another phase at each residence. On

request, the connection can be upgraded to 3-phase by exchanging the meter and adding two more fuses to the already present 3-fuse box.

Dear Jeff: OK No tap on the LV side of the (3 phase) transformer. One 230 VAC wire and neutral wire go to house from the transformer.

The non-PME scheme: neutral is "earthed" only at the sub-station AND a local earthing of a separate wire that seems to serve the same function as the North American green wire is provided.

The PME scheme: no earthing takes place; at the house entrance, the neutral is connected to what seems to serve as the green wire (the "local protective earth wire").

Thinking now about installing an antenna and radio: with the PME scheme the radio's case is connected to the "local protective earth wire" and yet the outside of the coax is often going to be connected to an actual earthing. I expect some current.

When I do the same thing here with the green wire connected to the radio's case and the outside of the coax well attached to an extensive earthing system, nothing happens because all of the earthings are connected together. Most important of all, if I grab an exposed bit of the radio while holding the unattached coax connector, no tickle is felt.

It sounds as if a standard part of each radio amateur faced with a PME system is to use an isolation transformer.

Thanks too to you Jeff for significantly expanding my understanding of how different people arrive at a solution to the same issue. By the way, are you a radio amateur?

73, Mac N8TT

No, there is no centre tapping, the supply is direct from one of the 3
phases at 230V+/- wrt neutral.

> At the service entrance: one scheme connects the neutral to an
> earthing. An alternative (called 'protective multiple earthing' (PME))
> does not connect the neutral to an earthing, but connects exposed metal
> in the house to an earthing. Wow! The latter scheme is expected in new
> construction.

No, one scheme leaves the neutral floating (at the consumer's end,
grounded at the sub-station) and provides an additional protective earth
wire locally via an earth stake (or in the past bonding to water pipes etc).

PME bonds the local protective earth wire to the neutral at the
consumer's end, and all exposed metal is bonded to that wire. NO
external earths are allowed (without modification of the scheme).

> It is not immediately clear what the advantage of the PME scheme might
> be. Your caution about RF grounds is well placed.

The claim is that because the earth is provided by the supply company is
it more reliable than a local earth stake. Personally I am not convinced
by the whole scheme.

Have a look at:
<electrical.theiet.org/wiring-matters/16/earthing-questions.cfm?type=pdf>

for more info

I would not be surprised if this system would be abandoned.
The operating companies of the electric grid have been changed from
state-owned into private companies, and we are already seeing the
deterioration resulting from such changes. This combined with the
high copper prices of today could surely mean that new connections
will be made single-phase.

> In the North American scheme, most HV and LV cables are "in the air." This

We consider such systems ugly and unsafe. Even HV cables are sometimes
run underground, although this costs a lot of money. It is mainly done
in cases where residential areas have expanded to places where HV overhead
cables already existed.

> Each of the disclosed systems has advantages and costs. It is fascinating
> to see how different systems value the costs.

I think an important difference is "who is the decisionmaker".
Commercial companies tend to look only at costs, state-owned companies
tend to look more at environmental issues.

Dear Rob: It certainly seems that you have well described the considerations.

Our houses tend to be farther apart, and low cost wins over potential ugliness. Lack of safety is not believed. An earthed wire is run above the HV 3-phase and does a good job of providing a low impedance path for lighting. One side of the HV to LV transformer is earthed as well as the center tap of the secondary (Neutral). The neutral is again earthed at the service entrance as is one end of the green wire running unimpeded to every human touchable conductor. Additionally, the house wiring is run at half the voltage common in Europe. Plugs and receptacles are standardized, which makes almost certain the appliances are properly connected. (In the UK it appears that appliances are sold without a plug and rely on the consumer to do the right thing.)

You have so well said, in effect, that every group of people have a different set of values that they place on things. If the money is available, the system in the Netherlands is invisible, flexible (with 3-phase ready when needed), and with the use of the equivalence of a green wire only diminished in safety from the NA system by using twice the voltage.

Indeed, if I were planning the electrical distribution system for a research laboratory, I would seriously consider using the Netherland scheme with half the voltage.

Afraid VHF will not reach to the Netherlands. Warm regards and thanks,
Mac N8TT

Sure, and I think the plugs/sockets in use in the UK and those used
in the remainder of Europe are also much safer than the ones used
in the USA.
The USA types have the tendency to expose live pins when the plug is
partly removed, something that does not happen here.

"half the voltage" also doesn't matter much when the voltage is unsafe
to touch anyway. And it means "double the current" as well, which
increases the problem of overheating of bad contacts.

I'm sure the USA would go for a system like the European when it had
the chance to change. This is something that has been decided in the
past and is not so easy to change later, which is why it remains as it
is.

If you actually knew anything about electricity, which you don't, you
would know that under normal circumstances there is no current in the
earth ground connection.

The earth ground connection is for safety and current will only flow if
something is wrong.

This is also why radios powered by AC are connected to earth ground; it is
for safety against electrocution if something in the equipment breaks and
has NOTHING to do with the operation of the radio as a radio.

In Poland in the all power AC lines is an exccess of electrons.
The ground is necessary.

The details are such that more electrons is gain in one half of the cycle
than jump off in the second.

What the things are in your country?

In Poland is ignorant morons that know nothing about electricity babbling
stupid nonsense.

In the rest of the world it is as described above, i.e. there is no current
flow into ground unless something is broken.

Maybe in Poland everything is broken.

>> The earth ground connection is for safety and current will only flow if

I did something you are incapable of doing; I looked up the electrical
distribution system in Poland.

The distribution system in Poland is the same as the rest of Europe
and conforms to IEC 60446, which means, you babbling idiot, there is
no current in the ground connection unless there is a fault.

You are an ignorant, babbling, ineducable idiot that knows absolutely
nothing about anything related to electricity.

Eveything you post is stupid, utter, nonsesne.

It is not easy to describe it.
But in Poland the amateur-radio dipoles consists of the one radiator and the
counterpoise.
Simply speaking it is the Marconi antenna with the one radial.

Good morning Szczepan.
Oh dear! No, in Poland (and everywhere else for that matter) a dipole does not consist of a radiator and a counterpoise. An aerial of that description would not be called a dipole. I said this in a posting back on 8th July.

I shall have to doubt your claim of being "here to learn". It seems to me that all you intend to do is repeat statements which you believe are true and which the rest of us know to be false.

Over a period of several months you seem not to have made any progress in understanding the dipole which is a basic aerial. I suggest that, instead of wasting your time on this newsgroup, you visit an amateur radio station or acquire a book on basis aerial theory. As I wrote in my posting of 8th July: The ARRL (http://www.arrl.org/shop/Antennas/) and RSGB (http://www.rsgbshop.org/acatalog/Online_Catalogue_Antennas_37.html) both sell helpful books on aerials.

I hope you are able to understand this posting.
Best wishes, Ian.

ps: To the other Ian - yes, S* could be a computer program but I thought the purpose of the Turing test was to simulate a human being. S* seems incapable of learning. I wouldn't discount your theory but I also think that S* could be an elderly person who has poor short term memory or could be a young person having a (protracted) laugh or could be an alter ego of one of the people who posts replies. I can't tell which is correct but I am happy to try to help in a courteous and respectful manner. 73, Ian.

Yes. The leakages are also unsymmetric:
"Coronas may be positive or negative. This is determined by the polarity of the voltage on the highly-curved electrode. If the curved electrode is positive with respect to the flat electrode we say we have a positive corona, if negative we say we have a negative corona. (See below for more details.) The physics of positive and negative coronas are strikingly different. This asymmetry is a result of the great difference in mass between electrons and positively charged ions, with only the electron having

the ability to undergo a significant degree of ionising inelastic collision
at common temperatures and pressures."
From: http://en.wikipedia.org/wiki/Corona_discharge

In a power lines are also the counterpoise:
"Overhead power lines are often equipped with a ground conductor (shield
wire or overhead earth wire). A ground conductor is a conductor that is
usually grounded (earthed) at the top of the supporting structure to
minimize the likelihood of direct lightning strikes to the phase conductors.
The ground wire is also a parallel path with the earth for fault currents in
earthed neutral circuits. Very high-voltage transmission lines may have two
ground conductors."

The only difference between country are the textbooks.
You should know that before the IIWW in the Soviet Union, Germany and US
were quite different phisics.
Now are the same in the whole "free" world but the older books are also
avaiable.

Hello chaps. I've solved the puzzle of the what S* is. He's an out-of-work
comedy writer.
He says that in Poland they have a power supply that
operates with corona discharge as normal (I assume into the house) and
operates with lightning strikes as the norm.
Of most interest to us all will be S*'s assertion that physics varied from
country to country before WWII. Anyone know (or care to guess) who unified
physics around the world?
It's dull and drizzling here in my part of the UK. That posting from S* made
me smile so it did have a positive use (pun intended).

73 to all, Ian.

I want to run two or even three QRP (200mW) HF beacons to one antenna. Is it possible to build a duplexer to combine 8M and 40M or 30M and 40M or 30M and 20M. Does anyone have a pointer to a web site where I might get some tips?

Sure you can and the power is not limiated to QRP either. There are two
ways to go about it. Band pass filters or low pass/high pass filters. Look
up diplexers.

Here is an example and may be close to what you want.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about antennas or how they work, or for that matter, anything
else.

A dipole is a dipole whether it is used by a Polish amateur or a Tibetan
monk.

You don't even understand what an antenna is or the difference between
an electric field, a magnetic field, and an electromagnetic field.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all
the people that have successfully built hundreds that they are all wrong
and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on electromagntics
in any language?

Is it because you are too stupid to be able to understand the material?

As you have been told several times, the earth ground in an electrical
distribution system is for safety if something goes wrong or breaks.

On of the things that can go wrong is lightning striking the wires.

> The only difference between country are the textbooks.

The difference between the textbooks is the language they are written in.

Not picking on you, but here we go again with that damn diplexer\duplexer thing. Even the people that make them will sometimes call the diplexer a duplexer. Just look at the ads in the ham catalogs. I do know the differance, but the terms have been used wrong so much that it is no use trying to correct them here.

Maybe we can get Szczepan Bialek to chime in here so the thread can reach about 50 messages about the differance.

Are the electrons flowing into the diplexer? Do the diplexer have
the counterpoise? What did Marconi write about it?

As a normal in the all country is leakage. Corona is from time to time.

"Physics, Electricity . the loss of all or part of a useful agent, as of the
electric current that flows through an insulator"

In overhead power supply the air is an insulator.

The both (corona and leakage) are nonsymmetric in AC.
So the ground is the only remedy.

The definitions I've found generally seem to say a duplexer isolates two ports on the same, or very close to the same, frequency and that a diplexer isolates two ports on different bands.

The definitions I've found also generally seem to say a circulator is a 3 or 4 port device in which a signal to a port is directed to only the next port in order and says nothing about frequencies. And, as you said, is often used at microwave to act as a duplexer.

I would guess the definative definitions would be what the IEEE dictionary says, but I don't currently have access to that.

Hello Szczepan.
Neither you nor I would want to be near any "leaky" insulator. You appear not to understand the definition and meaning of "insulator". Your past behaviour indicates that there is no pint in trying to explain it to you. All I will suggest is that you try to acquire and read a textbook on the subject.

Regards, Ian.

ps: In the Subject line of this thread, who is the "UK earthling"?

Hello Szczepan.
Neither you nor I would want to be near any "leaky" insulator. You appear not to understand the definition and meaning of "insulator". Your past behaviour indicates that there is no point in trying to explain it to you. All I will suggest is that you try to acquire and read a textbook on the subject.

Regards, Ian.

ps: In the Subject line of this thread, who is the "UK earthling"?

That is yet further evidence that he is on another world (if not even in
another universe) where the Laws of Physics are quite different from
here. Maybe that's why I was subconsciously prompted to ask him what
colour the sky was in his world.

What means "here"?
All the Laws of Physics I "cope and paste" from Wiki. I am in "Wiki's
world".

> Maybe that's why I was subconsciously prompted to ask him what colour the
> sky was in his world.

You are fluent in English.
Write the color in "here" and I tell you if in the Wilki world is the same.

>tips?

If you check the web sites for the various beacon networks, NONE of
them transmit on more than one frequency at a time. The transmissions
on each band are done in rotation. You do NOT need a duplexer,
diplexer, perplexer, or antenna tuner.

The danger in transmitting simultaneously on multiple bands at the
same time is intermod mixing generated in the final stages of your
transmitter. Ask Field Day operators for how that works. For a
beacon, all you need is a multiband antenna of some sorts and a uP
controller to change bands and frequencies according to a set pattern.

<http://www.ncdxf.org/beacon/photos/index.html>
Contact anyone involved in the network for details and horror stories.

hi
i'm just new to this field and i need some help on it and i appreciate
any help...
my aim is to make a 315 or 433 transmitter and receiver so what ics is
the best for that and where can i buy them and so for the antennas(but i
would like to build them)...
thanks

It is not easy to describe it.
But in Poland the amateur-radio dipoles consists of the one radiator and
the
counterpoise.
Simply speaking it is the Marconi antenna with the one radial.
S*

One suggestion is that you talk with some technically competent people in
Poland and describe your definition of dipoles.

Most likely, they will not agree with your definition.

For the antenna use a piece of wire, a length of lamda/4 is fine.

Air is the "leaky" insulator.
I was many times under the 400kV line and I am still alive.
Is it dangerous in UK.

You probably do not know the difference leakage/breakdown.

Instalacja anteny dipolowej sklada sie z:
- anteny - promiennik i przeciwwaga, kt�re sa zbudowane z dw�ch
jednakowych przewod�w, lub kawalk�w metalu. Z racji tego, ze oba te elementy
sa identyczne (ksztalt, material, dlugosc), maja takie same parametry - sa
symetryczne.
- przewodu zasilajacego - kabel koncentryczny, w kt�rym sygnal
przesylany jest przez zyle wewnetrzna a powraca oplotem ekranu. Oplot i zyla
wewnetrzna maja inny przekr�j i ksztalt, a co za tym idzie maja inne
parametry elektryczne (np. impedancje) - sa niesymetryczne. "

And Bilou wrote: "Imagine the diameter of one half is infinite.
You now have a quarter wave over a ground plane.A well known
case."

As you see in Poland and "here" are the technically UNcompetent
people.

Do you see the difference between the Hertz dipole and the
radioamateur dipole?

Yet more babbling nonsense with no understanding of the text you have quoted.

You are an ignorant, babbling, ineducable idiot who knows absolutely NOTHING about antennas or how they work.

You don't even understand what an antenna is or the difference between an electric field, a magnetic field, and an electromagnetic field.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on electromagntics in any language?

Is it because you are too stupid to be able to understand the material?

There is not such thing a "radio amateur dipole", you babbling idiot.

A dipole is a dipole whether it is used by a radio amateur or a Tibetan
monk.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about antennas or how they work, or anything else for that
matter.

How many antennas have you built in your lifetime?

If you want meaningfull replies, you need to ask meaningfull questions.

What do you intend to transmit, modulation type, power levels, etc.?

That fields and the gravity are only in the textbooks (as e sperate
chapters).
They are also in engineering.
In physics is only one field.
Do you thing that in space are the seperate mechanismus?

Do not write that the charge at rest create the electric field and if it
travel it create magnetic field.

The antennas work according to physics law.

The electrons come out of the negative end of the battery. The Old Brits were smart. They didn't want the electrons to jump off of the ends of the cars, so they tied the positive ends of the batteries to the car chassis. Except for those cars they exported to Poland ;-) .

I think it had something to do with the cars driving on the left side
of the road...

Either that, or it rains so much in the UK the electrons that would
normally jump up are washed down by all that water so you have to put
the negative side up to capture the electrons...

The fun part of owning one of those cars was watching panic on someone's
face when you got a jump start and hooked the jumper cables up backwards.

In the UK, until around 1970, I think all cars had positive 'ground'. I
would be very surprised if USA cars were any different. I believe that
the reason for this is that it was supposed to reduce corrosion of the
electrical connections.

The change to negative ground seemed to coincide with the introduction
of more equipment with NPN transistors (which were generally designed to
have a positive power feed). For a few years, many car radios had a
polarity switch, and if you moved a radio from your old +ve ground car
to you new -ve ground car, you had to remember to change the switch
over. I recall one works colleague blowing up a rather good radio when
he didn't.

If your car had the old dynamo generator (which once they invariably
did), it was usually very easy to reverse the polarity. To do this, you
simply had to give the field winding of the dynamo a 'splat' of reverse
polarity (which reversed the residual magnetism) and (of course), change
over the battery connections (which sometimes entailed fitting a longer
battery ground cable). As the starter motor was series wound, it still
turned in the same direction.

I wrote: "That fields and the gravity are only in the textbooks (as e
sperate
chapters).
They are also in engineering."

Heaviside and Pointing assumed: "In this case very near the wire, and within
it, the lines of magnetic force are circles round the axis of the wire. The
lines of electric force are along the wire,"
So they had the result: "The whole of the energy then enters in through the
external surface of the wire, and by the general theorem the amount entering
in must just account for the heat developed owing to the resistance, since
if the current is steady there is no other alteration of energy. It is,
perhaps, worth while to show independently in this case that the energy
moving in, in accordance with the general law, will just account for the
heat developed." From:
http://en.wikisource.org/wiki/On_the_Transfer_of_Energy_in_the_Electromagnetic_Field

Is it true now?

"the lines of magnetic force are circles round the axis of the wire" is the
Biot-Savart law.
In physics no magnetic monopoles and no the lines of magnetic force.

If you read the whole article you see that Pointing was full of doubts.
Heavisde was en engineer and Pointing was a teacher:
"Poynting and the Nobel prizewinner J. J. Thomson co-authored a multi-volume
undergraduate physics textbook, which was in print for about 50 years and
was in widespread use during the first third of the 20th century.[5]
Poynting wrote most of it.[6]"

It is not easy to explain physics to children and engineers.
I am not a teacher and a textbook writer.
But I know that the electrons are. Heaviside and Pointing did not that when
they wrote EM.

The old cars have only a bulbs. There is an Edison effect. The positive
ground is better in such case.
Now you have many electronics devices. For them must be the negative ground.

Step by step and you will be an expert on electrons.

i want to make a remote control for 3 relays using the
encoders/decoders: pt2262 and pt2272 , it doesn't mine what kind of
modulation...
i recently found these 2 ics : u2741b and ata3741 . but what kind of
antenna do i need? is there any other thinks i have to know?

Use lots of ICs. It doesn't matter which ones. Just put a lot in.

Hello chaps.
If Szczepan means "INcompetent" when he wrote "UNcompetent " then I would have to agree with him and cite him as an example.
I also see that the quote, shown above, is from a CB site and not from an amateur radio site. [Shall we assume he doesn't know the difference between amateur radio and CB?]
Google translates it to:
" Installation of a dipole antenna consists of:
- Antenna - radiator and counterweight, which are made up of two
The same wires, or pieces of metal. Because of this, with both elements
Are the same (shape, material, length), have the same characteristics - are
Symmetrical.
- Power cable - coaxial cable in which the signal
Transmitted by wire inner braid and returns the screen. Braid and lived
Have a different inner diameter and shape, and thus have different
Electrical parameters (eg impedance) - are unbalanced. "

Still, Szczepan is good for a laugh.

73, Ian.

In a circuit one part is protected and the second is attacked. So the
polarity is not the key issue.

Edison in his DC supply used the 3 wire system. +110V, -110V and neutral.
I do not know what was preffered in the 2 wire.

It seems to me that in overhead wires should be the excess of electrons. In
a storm weather the bulbs shine for free.

Now almost all DC supply systems are like that in the modern car. In the
"live" wire is the deficit of electrons.

AFAIK, positive ground was never a standard in the USA.

While there may have been some exceptions in the very early days, all the
cars I've seen back to the 20's were negative ground.

I owned some positive ground British cars and there were "challenges", like
arguing with US mechanics that no, the battery wasn't backwards and putting
in anything but a British radio or electric fuel pump.

> The old cars have only a bulbs.

No, they did not.

British cars had positive ground until the 60's.

Radios started appearing in cars in the 30's as well as electric motors.

> There is an Edison effect.

The Edison effect is how vacuum tubes work and has nothing to do with cars.

> The positive
> ground is better in such case.

Having positive or negative ground has no effect on how vacuum tubes or
anything else works, it is simply a matter of convention as to which
side of the power source is concidered chassis.

> Now you have many electronics devices. For them must be the negative ground.

No, it is not a matter of "must", it is a matter of convention; either
way will work.

> Step by step and you will be an expert on electrons.

Like you?

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how ANYTHING works.

Everything you wrote here is utter, stupid, babbling, nonsense.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on electromagntics or even basic electricity in any language?

Is it because you are too stupid to be able to understand the material?

So what, you babbling idiot, lots of physicists write textbooks.

> It is not easy to explain physics to children and engineers.

Actually, it is quite easy to teach normal children and engineers, but
it would be impossible to teach anything to a moron like you.

> I am not a teacher and a textbook writer.

No, you are a babbling moron.

> But I know that the electrons are.

You don't know what ANYTHING is.

> Heaviside and Pointing did not that when
> they wrote EM.
> S*

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how ANYTHING works.

You don't even understand what an antenna is or the difference between
an electric field, a magnetic field, and an electromagnetic field.

Electrostatic and magnetostatic fields are created by DC.

An antenna is a device that converts the AC electrical energy at it's
teminals into electromagnetic energy which radiates from the antenna
and also coverts the electromagnetic energy which antenna intercepts
into AC electrical energy at it's terminals.

That is ELECTROMAGNETIC energy, not magnetostatic nor electrostatic
energy.

From http://en.wikipedia.org/wiki/Biot%E2%80%93Savart_law

"The Biot-Savart law is fundamental to magnetostatics, playing a similar
role to Coulomb's law in electrostatics. When magnetostatics does not
apply, the Biot-Savart law should be replaced by Jefimenko's equations."

What that means, you babbling idiot, is that Jefimenko's equations apply
to antennas, not the Biot-Savart law or Coulomb's law.

Jefimenko's equations were first published in the 1960's so anything
written before then is essentially irrelevant to a discussion of antennas.

Since an antenna is defined in terms of it's terminals, anything that may be connected to the terminals, such as a balun or a transmission line, has NOTHING to do with what the antenna is or how the antenna operates.

What that means is that ONLY the voltage at the antenna terminals effect what is going to happen, NOT how the voltage got there.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on electromagntics in any language?

Is it because you are too stupid to be able to understand the material?

>would like to build them)...

This sounds like a school class project. If so, we should not be
doing your homework as you will not learn anything.

Some general direction:
<http://www.linxtechnologies.com/en/products/modules/kits>
<http://www.rfsolutions.co.uk/acatalog/RF_Development.html>
<http://www.ti.com/tool/cc1101dk433>
<http://www.radiotronix.com/products/proddb.asp?ProdID=216>
etc. Google for "433 MHz development kit". These development kits
are NOT cheap, but will give you a clue as to what's involved in the
product development.

For antennas, Google for "433 MHz antenna". There are plenty to
choose from. Most likely, a 1/4 wave wire whip antenna will be
sufficient.

For antenna design help, Google for "433 MHz antenna design". This
might be useful for comparing different types of antennas:
<http://www.ti.com/lit/an/swra161b/swra161b.pdf>

> i want to make a remote control for 3 relays using the
> encoders/decoders

There are also commerical products that do roughly what you propose.
Reverse engineering the design and using similar components for your
project is possible:
<http://www.ebay.com/itm/170740349762>
<http://www.ebay.com/itm/170854388957>
etc...

How would anyone here know that as it depends on what kind of range you
exepect to get.

The simplest antenna would be a quarter wavelength piece of wire.

> is there any other thinks i have to know?

Probably.

Yes, that's the way coherent photons orient themselves around a wire carrying RF energy. We can forgive Heaviside and Poynting for being ignorant of photons but today, some of us have alleviated our ignorance.

University level textbooks.

Ooops, I forgot.

You are a babbling moron incapable of reading a textbook in any language,
thus you will always remain an ignorant, babbling, idiot.

"8 Polarization 319"

Could you look at this?

Is in Hecht's the polarised light as the transverse wave (Fresnel,
Heaviside) or,

The longitudinal waves transmitted from the two sources (dipole) (Faraday,
Lorenz, Tesla).

Yes; proved wrong like all your other babbling nonsense.

Once again you drag up crap written nearly 100 years ago that has long
been proven to be false.

You are a moron.

You question is pure, meaningless, babble.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about anything.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all
the people that have successfully built hundreds that they are all wrong
and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on electromagntics
or anything else in any language?

Is it because you are too stupid to be able to understand the material?

Yes, proved to be pure fantasy. The Standard Model is as close to reality as we have gotten so far. The modern-day atom smashers have proved just how ignorant the speculations of the earlier physicists really were.

> "8 Polarization 319" Could you look at this?

In my 4th edition, Chapter 8 starts on page 325. The first sentence says: "... light may be treated as a transverse electromagnetic wave." Nowhere does it say that light may be treated as a longitudinal wave.

"" In 1817, Young had proposed a small transverse component to light, while
yet retaining a far larger longitudinal component. Fresnel, by the year
1821, was able to show via mathematical methods that polarization could be
explained only if light was entirely transverse, with no longitudinal
vibration whatsoever.
From: http://en.wikipedia.org/wiki/Fresnel

As you see the Fresnel model is simpler than Young.
In the texbooks are only simple things.

The Authors MAY know that. So they wrote: "light may be treated". MAY
instead "Without of any doubts".

Yeah, so what?

Light can be viewed as a transverse electromagnetic wave, that has been
established.

> As you see the Fresnel model is simpler than Young.

Actually, no it is not, but it is all mute as that crap is almost
200 years old and knowledge, except for yours, has improved greatly
since then.

Nope, this just shows how stupid, ignorant, and ineducable you are, moron.

Light may also be treated as photons.

You are so utterly stupid you will NEVER be able to understand that elecromagnetic radiation can be viewed both as waves or photons.

You are a babbling idiot and a laughingstock.

Of course, technical authors avoid absolute assertions because they know that almost all knowledge is proven inaccurate sooner or later by the additional acquisition of human knowledge driven by finer-tuned experiments. What you don't seem to understand is that technical knowledge builds upon technical knowledge so that the latest theories that support the latest experiments are the best "knowledge" that we have so far. Without the 19th century giants in the field of physics, we couldn't have progressed this far, but those giants were simply ignorant of 21st century physics. Today we too, are still ignorant to a certain extent, but hopefully less ignorant than 19th century folk.

thanks that helped...
BTW i'm making a project for my own not any kind of homework.
i have one more question : if i wanted to make my device have a bigger
range like 500-1000meters should i put an amplifer before the antenna?
i should change the antenna in to yagi shouldn't i?

FCC 15.209
<http://louise.hallikainen.org/FCC/FccRules/2012/15/209/>
200 uv/meter maximum, measured at 3 meters. That works out to about
-46dBm ERP or about 12 milliwatts into a unity gain antenna.

This should explain how it all works:
<http://transition.fcc.gov/Bureaus/Engineering_Technology/Documents/bulletins/oet63/oet63rev.pdf>
See the calcs on Pg 29.

Claims 500 meters:
<http://www.sparkfun.com/products/155>
At 10mw, this is close to maximum legal. Anything more than that and
you're going to start interfering with wireless weather stations, car
alarms, etc.

The Giants discovered in XIX century that light is the oscillatory flow of
electrons.

> Today we too, are still ignorant to a certain extent, but hopefully less
> ignorant than 19th century folk.

In XX century was done the first rectenna: "A rectenna is a rectifying
antenna, a special type of antenna that is used to convert microwave energy
into direct current electricity. "
In XXI century are the optical rectennas.

But the first were the crystal radio:
"The simplest crystal radio receiver, employing an antenna and a
demodulating diode (rectifier), is actually a rectenna".
From: http://en.wikipedia.org/wiki/Rectenna

You wrote "latest theories that support the latest experiments are the best
"knowledge" that we have so far".

But there are plenty of theories. Which one is the best?

To have knowledge means know the facts not theories.

Every time yet another post on this subject arrives, I can't help thinking of the limerick about the 'Young man of Devizes' (a small town in Wiltshire, England). Those who have no idea what I'm talking about can Google.

Perhaps there's a similar one about a radio amateur whose dipole had unequal wire sizes?

Oh dear! The Wiki page tells us that a rectenna converts microwave energy
then says, inconsistently, that crystal radios (which operate on MW and LW)
are rectennas.
I think the rectenna was mentioned by Szczepan several months ago - are we
going around the loop once more?

Is it worth commenting about scientific method, theory and fact?
I'll say that reading Szczepan's postings makes a good spectator sport.

73, Ian.

But that has since been proved not to be a fact, i.e. their theory has been disproved. Just as Issac Newton's discoveries were a little off, so were the "Giants" about which you speak. In RF conductors, electrons do oscillate but they are much too slow to "flow". I can crawl on my knees faster than electrons flow in a wire and that has been proved by actual measurements. The RF fields/waves that are flowing around a conductor at the speed of light are photons like the ones you are using to read this screen, just at a different frequency. When you realize what is the nature of the thing that is incident upon your retina, you will understand EM radiation.

> But there are plenty of theories. Which one is the best?

The one that agrees with the latest experimental measurements. Einstein's theory that gravity curves space was just a theory until proved valid by actual experimental measurements. The CERN Large Hadron Collider is providing actual experimental measurements as we speak. If the measurements disagree with the Standard Model, we will have to change the Standard Model.

> To have knowledge means know the facts not theories.

We will probably never know all the "facts" - the best we can do is become less ignorant. All of our models of reality exist in human minds filtered through human senses none of which are perfect. For instance, entangled particles seem to violate the spirit of the speed of light limit, yet they have been proved to exist by experiments. And how is it possible for a huge carbon Buckyball to pass through two slots at the same time and interfere with itself on the other side? Seems to me that the particle is creating a wavefront in the structure of space.

The best models are the ones that best match the latest experimental evidence. Some of yours do not match the latest experimental evidence at all, i.e. seems that you are deliberately choosing to remain ignorant (or just pulling our legs).

Your calculator is correct. My -46dBm is wrong. It was late, I was
multitasking, the phone range, I was tired, etc. Sorry for the
muddle.
+10.8dBm converts to 12 mw.
<http://www.rapidtables.com/convert/power/dBm_to_mW.htm>

Then... I find a 433MHz radio that delivers +20dBm (100mw).
<http://www.sparkfun.com/products/10153>
By my reading of 15.209, that's overpowered unless operating with a
miserable -9dB gain antenna. From the manufacturers web pile at:
<http://www.hoperf.com/rf_fsk/>
they offer +10, +13, and +20dBm outputs and claim they all meet ETSI
and FCC regs. I dunno about that.

> unequal wire sizes?

"End-Fed Center-Fed Dipole (AKA Coaxial Vertical Dipole)

Really, that description is correct. Primarily constructed with coaxial cable the one half wave vertical dipole is fed from its bottom but the coax shield is left in place only up to near the center point (about ½ wave but the exact end point for terminating the shielding is determined by tuning) which becomes the actual "feed-point" ergo, the description. The center conductor continues up for about ½ wave past the point of termination of the shield." From: http://forums.qrz.com/showthread.php?286554-End-Fed-Center-Fed-Dipole

Are the wires equal or unequal?
Is it dipole, monopole or "dipole"?

The antenna would have to have -69 dB gain for 100 mw to radiate 12
NANOwatts.

Reminds me of the garage door hack.

At midnight, from a nearby hill, where you can oversee the whole city,
transmit with a few hundered watts all the door opener codes
in sequence. Use a software to feed the signals.

But even worse and the utmost of all evils, is the Dildo Hack.
You know they have remote controls also.
Every light that comes on in the city after your transmission,
is a feedback of success.

> But there are plenty of theories. Which one is the best?

Generally, the latest ones which have more experiments and data to back them up.

> To have knowledge means know the facts not theories.

To be Szczepan Bialek means to be an ignorant, ineducable, moron.

You are an ignorant, babbling, ineducable idiot who knows absolutely NOTHING about antennas or how they work.

You don't even understand what an antenna is or the difference between an electric field, a magnetic field, and an electromagnetic field.

An antenna is a device that converts the AC electrical energy at it's teminals into electromagnetic energy which radiates from the antenna and also coverts the electromagnetic energy which antenna intercepts into AC electrical energy at it's terminals.

A rectenna is simply an antenna with something that acts as a diode at it's terminals to convert the AC to DC.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on anthing in any language?

Is it because you are too stupid to be able to understand the material?

They jump off from the end (corona) after the time equal to speed of light.
They do not flow from the transmitter to the end of antenna. They kick the
next ones. It is the oscillatory flow.

The papers of Giants are now available. Try to compare the papers by
Heaviside-Pointing and Dirac.
Dirac was an engineer so he was tought on Heaviside-Pointing's EM. Dirac
never even mentioned EM.

Ia trying to pull you from the textbooks (where all is simplified) to the
paper of Giants.

Not exactly. When adding a bigger antenna, you will need to decrease
the transmit power to keep the field strength (V/meter) constant.

For example, assume that +12dBm tx power and 0dBm (unity) gain antenna
is the maximum legal. If you replace the unity gain antenna with an
+8dBi gain yagi, you will need to reduce the transmit power down to
+4dBm output to stay withint the maximum field strength requirement.

Note that you can calculate your maximum range if you know the various
numbers.

From the document you posted, P*G/(4*Pi*D^2) = E^2/(120*Pi)

Let G = 1, D = 3, E = 200uV then

P*1/(4*3.14*3*3) = (200e-6)^2/377 and

P/113 = 40e-9/377 so that

P = 113 * 106e-12 giving

P = 12e-9

This looks like NANOwatts to me.

You have been told time and time again that there is no corona in normal antenna operation.

You have been told time and time again that "oscillatory flow" is 19th century nonsense.

Why do you yet again repeat all this nonsense?

Why do you keep arguing with people who have hundreds of years of collective experience and many with engineering and science degrees, all of whom have told you this is nonsense?

You are an ignorant, babbling, ineducable idiot who knows absolutely NOTHING about anything.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on anything in any language?

Is it because you are too stupid to be able to understand the material?

It's not exactly ELMR but rather LMRS (Land Mobile Radio System) at
380-400MHz interfering with garage door openers on 315 MHz through
receiver blocking (overload):
<http://en.wikipedia.org/wiki/Land_Mobile_Radio_System>
This has been a known problem for at least 8 years, yet the garage
door manufactories haven't done anything in the way of improved
receivers. I guess a cheap bandpass filter and some shielding would
be too much for the cost concious garage door opener manufacturers.

Drivel: One of my customers was having problems with their garage
door opener. They said they could easily close the door from the end
of the driveway, but could not open it again from the same location.
When I arrived, I found that they had an aluminum garage door, with
the receiver mounted behind the door. Between the metal door and
aluminium foil backed insulation in the walls and roof, the garage
made an effective screen room. I moved the recevier and wire antenna
to a better location, which fixed the problem.

More drivel: Many years ago, I helped setup a 30 watt Mitrek 440MHz
portable repeater for an event. Since it used mechanical T/R relays,
the dropout time was set rather long to minimize contact cycling.
During the event, we had some traffic from drivers in the nearby
parking lot about being unable to operate wireless car alarms. Oops.
I turned down the TX power which allowed the alarms to operate
normally. Years, they switched to VHF, which stopped blocking the car
alarm receivers, and introduced triggering the car alarms.
Lesson learned: Use low tx power in parking lots.

Oh, I see.

You used 100 MILLIvolts (not MICROvolts) in your calculation! That's how you wound up with MILLIwatts rather than (NANOwatts).

>This looks like NANOwatts to me.

Well, that looks right. I'll do the short version:

From Pg 29.
<http://transition.fcc.gov/Bureaus/Engineering_Technology/Documents/bulletins/oet63/oet63rev.pdf>

Assuming a 0dBi gain antenna:
Power = 0.3 FS^2
where
FS = field strength in Volts/meter
P = Watts
Plugging in:
Power = 0.3 * (200 uV/m)^2 = 0.3 * (200*10^-6 V/m)^2
Power = 0.3 * 4*10^-8 = 12*10-9 = 12 nano watts.
Argh... You're right.

However, that can't be the correct maximum power. It's much too low
to be useful.

Digging out a cheat sheet from:
<http://www.ti.com/lit/an/swra090/swra090.pdf>
CEPT (European) 1e and 1e1 are 10mw and 1mw respectively.
However, digging down to the FCC stuff on Pg 11, I find that the specs
are really in FCC 15.231(b).
<http://louise.hallikainen.org/FCC/FccRules/2012/15/231/>
and are approx 11,000 uV/meter. Grinding the numbers again...

Assuming a 0dBi gain antenna:
Power = 0.3 FS^2
where
FS = field strength in Volts/meter
P = Watts
Plugging in:
Power = 0.3 * (11000 uV/m)^2 = 0.3 * (11000*10^-6 V/m)^2
Power = 0.3 * 0.000121 = 36 milliwatts.

Thanks for catching my mistake and I'll double check the numbers
(again) when I get home from some service calls.

My own situation was that the remotes in the cars lost range. You could
open the door if the car was practically touching the door, but not much
farther back.

Using various test gear, I found an interfering signal that was just a few
feet away. The remote opener screwed on the outer wall had failed in the
"on" position and was closer to the receiving antenna than the openers in
the cars.

The Genie engineers were quite interested in getting that failed remote in
their hands to examine the problem. They were amazed that I located the
problem, but it's all in the test gear.

Yes, but you are reading only part of the regulations. These are
PERIODIC radiators. Please read the whole thing and tell me how often
and for what period you can transmit.

> Thanks for catching my mistake and I'll double check the numbers
> (again) when I get home from some service calls.

Very well. Please point out the pertinent parts that allow this
(undisclosed) mode of operation.

I've seen something like that in action. The problem is in the way
the rolling code works and a rather dumb design decision in the remote
key fob:
<http://en.wikipedia.org/wiki/Rolling_code>
<http://www.atmel.com/Images/doc2600.pdf>
When you press the key fob button, some remotes just continue to spew
codes like a machine gun. I think (not sure) that my 2001 Subaru key
fob does this. The problem is that the system compares the received
code with up to 256 anticipated codes that the remote might send. The
idea is to catch up in case the key fob was accidentally pressed and
the receiver missed the transmission. However, if you send 256 codes,
the transmitter and receiver go out of sync and must be
re-synchronized. I actually tried it by pressing the button 256 times
and found that I could no longer unlock the car. It is my
understanding that modern chips have a better algorithm that doesn't
have this problem.

When your transmitter in the outer wall stuck on, it probably ran out
of codes fairly quickly. After that, it was no better than a jammer.

>The Genie engineers were quite interested in getting that failed remote in
>their hands to examine the problem. They were amazed that I located the
>problem, but it's all in the test gear.

Nicely done especially since you had no idea what was causing the
problem.

>Wayne
>W5GIE (exiled to W6)

I live in W6-land and methinks it's is paradise (except for the
government, traffic, taxes, gas prices, etc).

Ummm... let's set some ground rules first. With all due respect, if
your interest is learning something about FCC rules-n-regs, how the
stuff works, how to make it all play together, how to grind the
numbers, and where to find pieces, I'll bust my posterior to supply
you with direction and/or answers. However, if your intent is make me
jump through hoops, burn my time, or supply information that you could
easily excavate on your own, please find someone else to play your
game. I don't mind being wrong, being told I'm clueless, or doing
research. I do mind wasting my time.

See the last paragraph of 15.231
<http://louise.hallikainen.org/FCC/FccRules/2012/15/231/>
In addition, devices operated under the provisions of this
paragraph shall be provided with a means for automatically
limiting operation so that the duration of each transmission
shall not be greater than one second and the silent period
between transmissions shall be at least 30 times the
duration of the transmission but in no case less than 10
seconds.

The method of modulation is not specified. Whatever modulation method
is chosen must comply with 15.231(b)(3)(c)
The bandwidth of the emission shall be no wider than 0.25%
of the center frequency for devices operating above 70 MHz and
below 900 MHz. For devices operating above 900 MHz, the emission
shall be no wider than 0.5% of the center frequency. Bandwidth
is determined at the points 20 dB down from the modulated carrier.

At 433MHz, that yields about 1MHz bandwidth which is adequate for most
anything between on-off keying to perhaps frequency hopping spread
spectrum.

>> Thanks for catching my mistake and I'll double check the numbers
>> (again) when I get home from some service calls.

>
>Very well. Please point out the pertinent parts that allow this
>(undisclosed) mode of operation.

Sorry, but undisclosed modes are by definition undefined and therefore
not codified in the FCC rules-n-regs.

> seconds.

This paragraph is part of paragraph (e) which allows only

260-470 1,500 to 5,000^1 150 to 500^1
^1Linear interpolations.

so that, with interpolation to 433, it works out to about 4383 uV/m.

This, then, allows .3*(4383e-6)^2 or about 5.76 microwatts for 1 second
out of every 30 seconds. Or, for 1/3 second out of every 10 seconds, but
never more frequently.

>>> Thanks for catching my mistake and I'll double check the numbers
>>> (again) when I get home from some service calls.

You're welcome (again).

W5DXP wrote; "In RF conductors, electrons do oscillate but they are much too slow to "flow".
In conductors is a lot of electrons.

EM waves are in textbooks. The electron waves propagate in plasma. There is also a lot of electrons.
Everything what fall down on the Sun is "reworked" into plasma.

> But is in unnormal operation. When it (corona) is seen?

The quad beam antenna was invented by Clarence Moore to solve a corona problem encountered with a Yagi-type beam at 10k' in the Andes Mountains. Here is that interesting history:

http://lists.contesting.com/_towertalk/2002-11/msg00393.html

The point is that electron flow corona destroyed the Yagi-type beam but there was negligible corona using the quad beam because the standing wave voltage maximums are much lower with the quad. Yet the two antennas radiated approximately the same magnitude of RF waves. This proves that electron flow is not the mechanism associated with RF radiation. It is simple to understand once one realizes that electron flow corona results in non-coherent radiation while normal photonic RF radiation is coherent.

As you have been told many times but are too stupid to understand,
electromagnetic radiation can be viewed as either waves or photons.

Why are you asking again, are you stupid, drunk, or insane?

>> A rectenna is simply an antenna with something that acts as a diode at
>> it's terminals to convert the AC to DC.
>
> In AC electrons oscillate. In DC electrons are flowing for ages.
> Where they come from?

No; in AC electrons periodically change directions and in DC electrons
flow in one direction only.

An antenna is a device that converts the AC electrical energy at it's
teminals into electromagnetic energy which radiates from the antenna
and also converts the electromagnetic energy which antenna intercepts
into AC electrical energy at it's terminals.

A diode converts AC into DC.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about anything.

Well, I can't argue with the fact that they are being produced. If they really meet the FCC regulations, I have been unable to prove it. I have looked all over the FCC site under part 15 and never found an area that allows such power.

If you ever find it, I would appreciate a link to it.

Only when you output kilowatts of power and there is some point in
the antenna where the voltage is very high.

But a radio amateur knows that it is possible to transmit signals with
arbitrarily low power and that the range becomes smaller but it still
works all the time. So even with very low voltages, where there is
no corona, a transmitter still transmits.

Good afternoon Szczepan.
Dipoles and monopoles are two different designs of aerial. A basic knowledge
of (I think) Latin would prove this to you.
You'd find these two types of aerial in basic/entry-level reference books
for ham
radio. Please use the links to the ARRL and RSGB book shops and get yourself
a decent book on the topic of
aerials.

Regards, Ian.

Oops and thanks (again). I keep fudging the numbers (unintentionally)
to what I think they should be, instead of what they are. Very
embarrassing.

Microwatts doesn't seem to make sense as there are products being sold
that advertise 10mw and 100mw output power levels. Obviously they are
not being certified under Part 15. However, I can't find another US
service on 433MHz that qualifies (except ham radio). FCC frequency
allocations table is of no use:
<http://ecfr.gpoaccess.gov/graphics/pdfs/er27ja12.018.pdf>
433MHz is an ISM band, but only in region 1 (Europe) and not in region
2 (US).
<http://en.wikipedia.org/wiki/ISM_band>
My guess(tm) is that the higher power 433MHz devices can only be sold
in Europe. Yet, that's not apparent on any of the sites selling
433MHz data radios.

"FCC Compliance testing Using the MICRF112"
<http://www.micrel.com/_PDF/App-Notes/an-55.pdf>
Page 9 has the calcs for a typical key fob transmitter.
36 microwatts.

Unless I missed something, you're correct. I can't find anything in
the US rules (except Part 47 ham radio) that allows milliwatt level
operation on 433MHz. It is allowed in Europe under CEPT rules to 10mw
at 10% max duty cycle:
<http://www.ero.dk/47DA77DD-A2B7-4DD2-8288-3900A875B3F6?frames=no&>
(MS Word Document). Nothing that allows 100mw but possibly in another
foreign country.

I've only done certifications for 900MHz, 2.4GHz, and 5.7GHz, FCC
15.247 hardware. The 433MHz stuff is new to me. FCC 15.247 allows 1
watt into 6dBi.

It appears that we have both looked very hard and have come to the same conclusion. I now wonder if the US suppliers are unaware of the region 1/region 2 thing.

I saw that. Lower left corner of page 4 says that continuous operation is allowed. Where do they get that?

Yeah, my conclusion as well.

Here in Europe, 10mW ERP is allowed on 433 MHz. This of course does
not mean that all devices have that much power. I can understand that
a 13dBm transmitter device is allowed with an inefficient antenna and
still result in 10mW ERP or less. 100mW seems to be a bit off the
scale, who would want to waste that much power.

Unfortunately, "allowed" and "in use" are different things. It is
allowed to used 10mW handy talkies on 433 for unlicensed use, but in
reality those users have the wellknown Chinese devices (Wouxun etc)
that output 4 watts. Or they use a 50W standard HAM mobile transceiver.
Without license. On the amateur bands.

I've run into interference in a local shopping mall parking lot, which
is sufficient to almost completely block 433 MHz car keyfobs from
working. It comes from a local noodle restaurant, which uses a
wireless order-taking system... from the sound of the transmissions
over the air, I think the central node is polling the hand-held order
entry units 3-4 times per second (well in excess of the Part 15
periodic radiator limit). It's quite audible for about a city block
around the restaurant, in at least some directions.

I got a look at one of the handheld terminals, and did not see any
sort of FCC licensing or type-acceptance sticker.

Why am I not surprised? I think this could get out of hand just as the 27 MHz band did. There is a slight difference here. The military has an interest in the 70 cm band, so this may become very interesting. Note that near some military bases, some gadgets are becoming next to useless already.

> See section (e):
> Intentional radiators may operate at a periodic rate exceeding
> that specified in paragraph ...

Yes, but continuing with paragraph (e) includes the last paragraph which
you quoted earlier:

<quote you>

See the last paragraph of 15.231
<http://louise.hallikainen.org/FCC/FccRules/2012/15/231/>
In addition, devices operated under the provisions of this
paragraph shall be provided with a means for automatically
limiting operation so that the duration of each transmission
shall not be greater than one second and the silent period
between transmissions shall be at least 30 times the
duration of the transmission but in no case less than 10
seconds.

</quote you>

And this last paragraph is part of FCC paragraph (e).

There is nothing in that section which allows continuous transmission.

> The field strength is limited to about 4500 uV/meter. There's also
> some notes on the topic on Pg 14 of the TI app note:
> <http://www.ti.com/lit/an/swra090/swra090.pdf>

It is parroting paragraph (e). Nothing new nor informative there.

I'm enjoying this, Jeff. Finally, I have someone with which to kick this
around and learn something. I'd really like to get to the bottom of this
whole thing.

Should we take this somewhere else? I wonder if anyone else is
interested. Maybe Rob? What do you think? If it benefits only three
people, is it worth it?

I'm definitely interested, and I think it's sufficiently on-topic for
this newsgroup that it's quite reasonable to continue the discussion
here.

I find it very useful since I am interested in the low (weak signal) end
of 70cm.

Don't assume that because we aren't poking our noses in that there
aren't interested people out here. Please carry on where I can see it.

I've always wondered if the imported 433MHz devices were running legally.

There should always be a DC path around the diode, or the crystal radio
will not work.

Normally there is a tuned circuit at the input, which consists of a
coil and capacitor in parallel. The DC flows through the coil.

At the output there either is a high-impedance magnetic headphone,
which conducts DC through its coil, or a crystal headphone with a
resistor in parallel for the DC path.

The electrons circulate around the DC path in the receiver.

No you were telling that electrons were jumping off the antenna because
of corona, which is nonsense when the transmitter is low power, and
points to an operational problem when the transmitter is high power.

It's unlikely that any high power short-range devices are legally on
sale in Europe. The UK spec is 10mW erp (which is probably the norm).
<http://stakeholders.ofcom.org.uk/binaries/spectrum/spectrum-policy-area/
spectrum-management/research-guidelines-tech-info/interface-requirements/
IR_2030.pdf>
page 17.

Of course, over here, 70cm is only 430 to 440MHz, and (for various
reasons) most of the simplex activity is 432 to 434MHz. An SRD
allocation at 433MHz can cause some interesting problems - especially to
car key systems which, in the past, have often had fairly 'elementary'
and unselective receivers. It is said that great fun can be had when
you're sitting in your car in the shopping mall carpark, waiting for
your wife to emerge from the shops.

"The wire antennas used with crystal receivers are monopole antennas which
develop their output voltage with respect to ground. They require a return
circuit connected to ground (earth) so that the current from the antenna,
after passing through the receiver, can flow into the ground."

Unnormally you can have only the monopole antenna and the diode and ground.

What current is flowing between the diode and the ground?
Is it dependent on the distance from the transmitter?

Dear Szczepan,

I have explained to you how it works. That explanation is correct.
Please stop adding incorrect information and asking stupid questions.

I know two stupid Poles. Are there more?

The words "almost always, almost every time, almost invariably and
almost without exception" are missing.

As crystal receivers are normally used at low frequencies (long and
medium wave), the obvious antenna to use is an end-fed long wire
monopole. This, of course, requires a ground.

However, in principle, you could use a (probably large) dipole, provided
you modified/designed the circuit of the receiver so that it would take
a balanced input (which would probably also be low impedance).

I'm pretty sure that some of the early radar receiving systems used
essentially a dipole antenna feeding a crystal receiver.

A dipole consists of two poles. As some Poles can only count to
one, they will have a different explanation.

I looked at one of the Hoperf parts and found this:

"The RFM69H is intended for applications over a wide frequency range,
including the 433 MHz and 868 MHz European
and the 902-928 MHz North American ISM bands."

That's the catch. Although it is capable of operating at 10dBm on 433,
you are responsible for only doing that in Europe where it is legal.
Otherwise, you may operate it at its maximum power capability here in
the US on 915MHz. Under those conditions, it complies with FCC regs.

> Where electrons come from?

The electrons are always in the conductors and they stay in the conductors,
they don't "come" from anywhere.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how anything works.

An antenna is a device that converts the AC electrical energy at it's
teminals into electromagnetic energy which radiates from the antenna
and also coverts the electromagnetic energy which antenna intercepts
into AC electrical energy at it's terminals.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all
the people that have successfully built hundreds that they are all wrong
and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on anything
in any language?

Is it because you are too stupid to be able to understand the material?

You are an ignorant, babbling, ineducable idiot who knows absolutely NOTHING about anything.

An antenna is a device that converts the AC electrical energy at it's teminals into electromagnetic energy which radiates from the antenna and also coverts the electromagnetic energy which antenna intercepts into AC electrical energy at it's terminals.

Since an antenna is defined in terms of it's terminals, anything that may be connected to the terminals, such as a balun, transmission line, or diode has NOTHING to do with what the antenna is or how the antenna operates.

What that also means is the current flows between the antenna terminals no matter what type of antenna it is.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

You are right:
"A simple rectenna element consists of a dipole antenna with a diode
connected across the dipole elements." And:
"A nantenna is a very small rectenna the size of a light wave, fabricated
using nanotechnology, which acts as an "antenna" for light,"

Each rectenna arm (or dipole element) must be shorter then 1/4 WL.

But: "Where the electrons come from?

Or you could use a ferrite antenna with a coupling coil wound to
match the impedance.

Oh, wait, that would be a coil wound around a ferrite bar with no
ground connection whatsoever and no place for jumping electrons.

Good Lord, could it possibly work with no jumping electrons and no
ground?

> I'm pretty sure that some of the early radar receiving systems used
> essentially a dipole antenna feeding a crystal receiver.

Yes, some early microwave receivers were in essence crystal sets until
the components became available to build the stages necessary for a
superheterodyne receiver.

Most of the simple Gunn diode based door openers are also basically crystal
set receivers.

Where do electrons jump from in a horn antenna?

On Wednesday, July 25, 2012 3:11:31 AM UTC-5, Szczepan Bialek wrote:
> So "enters in = radiates from"?

To the extent that RF energy penetrates to a skin effect depth, the conductor is not perfect and dissipates some of the power. All real-world antennas dissipate some of the RF power in I^2*R (and possibly dielectric) losses. In an efficient antenna, most of the system energy is "lost" in space as coherent radiation.

When the free electrons in a conductor are acting as a bucket brigade for the RF fields/waves/photons, they are essentially vibrating in place because of their very slow drift velocity. Those I^2*R losses in the wire are due to coherent RF photons that are absorbed by electrons and not re-emitted as coherent RF photons but are instead converted to heat energy, the price that Mother Nature requires be paid for all that vibration. In an antenna that is 90% efficient, 10% of the coherent RF energy is converted into non-coherent heat energy. That's the energy that Poynting was talking about.

Good afternoon Szczepan. I see that, after several weeks and lots of
postings, you still do not understand the difference between a monopole and
a dipole. Please also note the phrase "behaves as".
Kindest regards, Ian.

```
The average speed.
The circuit with an antenna was named "open circuit" before Maxwell.
Maxwell discovered that the current is "prolongated" in the insulator
(displacement current) so the all circuits are "closed".
So at the bonduary the electrons must jump off. And come back.
In each textbooks is wrote that electrons jump off from a conductor and come
back.
But sometimes this phenomena is not symmetric.

"behaves as"means that radiate the same as the real dipole.

"I see that, after several weeks and lots of postings, you still do not understand the difference between the Hertz dipole and Marconi antenna."

Kindest regards,
S*

Everything you just wrote is babbling, moronic, nonsense.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how anything works.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all
the people that have successfully built hundreds that they are all wrong
and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on anything
in any language?

Is it because you are too stupid to be able to understand the material?

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about anything.

You don't even understand what an antenna is or the difference between
an electric field, a magnetic field, and an electromagnetic field.

An antenna is a device that converts the AC electrical energy at it's
teminals into electromagnetic energy which radiates from the antenna
and also coverts the electromagnetic energy which antenna intercepts
into AC electrical energy at it's terminals.

Since an antenna is defined in terms of its geometry with respect to its
terminals, anything that may be connected to the terminals, such as a balun,
transmission line, or ground has NOTHING to do with what the antenna is or
how the antenna operates.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?
```

The same as any other antenna; they are always in the conductor and don't
"come" from anywhere.

The voltage developed at the antenna terminals causes the electrons in
the conductors to move.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how anything works.

Hello Jimp. I still prefer to think of it as an electron doing its own
thing for independence.

Seems to me that most of the postings from Szczepan tend to be
copy-and-paste ones rather than "original thought" ones. I suspect he is an
old East European having a laugh at us Westerners but I wouldn't dispute the
other Ian's suggestion that we're dealing with a Turing test.

Is a moron akin to a proton?

73, Ian.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about antennas or how they work.

You don't even understand what an antenna is or the difference between
an electric field, a magnetic field, and an electromagnetic field.

Electrostatic and magnetostatic fields are created by DC.

An antenna is a device that converts the AC electrical energy at it's
teminals into electromagnetic energy which radiates from the antenna
and also coverts the electromagnetic energy which antenna intercepts
into AC electrical energy at it's terminals.

That is ELECTROMAGNETIC energy, not magnetostatic nor electrostatic
energy.

From http://en.wikipedia.org/wiki/Biot%E2%80%93Savart_law

"The Biot-Savart law is fundamental to magnetostatics, playing a similar role to Coulomb's law in electrostatics. When magnetostatics does not apply, the Biot-Savart law should be replaced by Jefimenko's equations."

What that means, you babbling idiot, is that Jefimenko's equations apply to antennas, not the Biot-Savart law or Coulomb's law.

Jefimenko's equations were first published in the 1960's so anything written before then is essentially irrelevant to a discussion of antennas.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on anything in any language?

Is it because you are too stupid to be able to understand the material?

>around the restaurant, in at least some directions.

Lovely. Remind me to rant on the topic of wireless systems that belch
RF when there's no data to transfer.

>I got a look at one of the handheld terminals, and did not see any
>sort of FCC licensing or type-acceptance sticker.

Here's the FCC interference complaint form:
<https://esupport.fcc.gov/ccmsforms/form2000.action?form_type=2000F>
It's an election year, so the FCC EB may actually be interested in
doing something. At the least, the restaurant owner will get a
warning letter in the mail.

You still have not explained how it is possible that the behaviour
is not symmetric and still there is no nonlinearity in the antenna.

>

Continuing the investigation, I find that the US has no ISM band
anywhere near 433MHz. The closest is 915MHz.

Interestingly, on that band, the FCC says:

"ï¿½ 18.305 Field strength limits.
(a) ISM equipment operating on a fre-
quency specified in ï¿½ 18.301 is permitted
unlimited radiated energy in the band
specified for that frequency."

Wow! Unlimited!

The catch is that you may have no emissions outside the ISM bands
exceeding 25uV/m at 300m. That would be equivalent of less than 2
microwatts of 2nd, 3rd,.... etc, harmonics and other stuff being
radiated by the antenna. That, I think, would be about -37dBc when
running 10mW. The more power you run, the harder it gets to filter.

In addition, I still have some questions in my mind about certification.
Just because a manufacturer says it will meet the requirements, doesn't
necessarily mean it is certificated. Part 15 (not ISM) allows us to

build our own transmitters which are not for sale. But, I can find no mention of that in part 18 (ISM).

Still lots of questions out there.

Ian wrote:
"Normally there is a tuned circuit at the input, which consists of a
coil and capacitor in parallel. The DC flows through the coil.

At the output there either is a high-impedance magnetic headphone,
which conducts DC through its coil, or a crystal headphone with a
resistor in parallel for the DC path."

Next the DC flows into "ground":
"The use of the term ground (or earth) is so common in electrical and
electronics applications that circuits in portable electronic devices such
as cell phones and media players as well as circuits in vehicles such as
ships, aircraft, and spacecraft may be spoken of as having a "ground"
connection without any actual connection to the Earth. This is usually a
large conductor attached to one side of the power supply (such as the
"ground plane" on a printed circuit board) which serves as the common return
path for current from many different components in the circuit." From:
http://en.wikipedia.org/wiki/Ground_(electricity)

Each charged body (conductor and insulator) losts the charge (leakage) with
time.

Add the additional real ground and tell us the results.

NO NO NO NO NO!!!!

The DC flows in a circle inside the receiver!!!

When you see the schematic diagram of a working crystal receiver,
you can make a trip trough the diode, through other components in
the receiver, all conducting DC, back to the the point where you
started at the diode.

This path must exist and this is where the DC flows.
When there is no such path, a DC voltage equal to the peak value
of the HF voltage will develop across the diode, the diode will
no longer conduct, and there is no more rectification. Hence the
receiver will not work.

This is not related to "ground". There must be HF voltage at the input of the receiver, but it is not important if it is between a monopole antenna and ground or between the poles of a dipole.

You can even make a crystal receiver with a ferrite rod as an antenna, which will operate without any ground.

The oscillatory flow of electrons is inherently not symmetric.
Always some of them jump off from the antenna end. VSWR =1 means that all
jumps off.

It should be obvious for you if you see the electrons in the wire.
For Pointing there no electrons. There are only fields around the wire.
He wrote: " Formerly a current was regarded as something traveling along a
conductor, attention being chiefly directed to the conductor, and the energy
which appeared at any part of the circuit, if considered at all, was
supposed to be conveyed thither through the conductor by the current. "

And next: "The aim of this paper is to prove that there is a general law for
the transfer of energy, according to which it moves at any point

perpendicularly to the plane containing the lines of electric force and magnetic force, and that the amount crossing unit of area per second of this plane is equal to the product of the intensities of the two forces, multiplied by the sine of the angle between them, divided by , while the direction of flow of energy is that in which a right-handed screw would move if turned round from the positive direction of the electromotive to the positive direction of the magnetic intensity".

The teachers buy it.

Before Haeviside and Pointing was " something traveling along a conductor".
What do you prefer: electrons or fields?

Each voltage disappear (leakage) with the time. That before diode and that after. The leakage is always and everywhere.
The leakage is surface and humidity dependent.
>
> You can even make a crystal receiver with a ferrite rod as an
> antenna, which will operate without any ground.

Leakage do the work.

You keep claiming that. But you don't explain why there is no
nonlinearity in the antenna. When the antenna is nonlinear, as you
claim, there must be intermodulation in the antenna. But in a well
constructed antenna, there is no intermodulation. So there is
no unsymmetric flow of electrons.

I don't care what people have written in the 19th century. Please
stop bringing that up. I am only interested in how things are
explained today.

Can't you read?
Or are you even dumber than I already think?

The path is not to the ground. It is a circle inside the receiver.

> The leakage is surface and humidity dependent.

Only a bad designer will design equipment that requires leakage to
operate. Of course there will be some bad schematics of crystal receivers
around, where there is no obvious DC path around the diode, and maybe
sometimes (depending on construction details) one may be able to hear

some sound, but it is NOT the way it should be done and it is NOT the explanation of the workings of the receiver.
Except maybe to someone in 1900, who did not understand it fully.

>> You can even make a crystal receiver with a ferrite rod as an

They fully understand it. They discovered the induction and the leakage (in
electrostatics).
You simply do not understand that your path is the countrpoise.

Leakage can transfer the charge from one body to the another.
The same should apply to "brain to brain".

Everything was discovered in XIX (for the radio):
"The electrical waves produced by the oscillations at A traveled along the wires and were reflected at the far ends. Lodge knew that the longer spark at B3 was due to what he called the "recoil impulse" or "recoil kick" at the end of the wires where the waves were reflected.[4] At spark gap B3 both the incident wave and the reflected wave had their maximum values and were in phase. This produced a voltage twice as large as the voltage at spark gap A.
From: http://www.antiquewireless.org/otb/lodge1102.htm

Is it still true?

If yes, than you must admit that the leakage must be stronger at "recoil kick" when the voltage is doubled.
"So there is the unsymmetrical flow of electrons." Do you agree?

There is no counterpoise in this antenna.
The full-wave bridge rectifiers provide a DC path through the load
without requiring a DC path in the dipole.

Many elements are used because this antenna is supposed to operate
on microwave, and thus a single element has only a very small capture
area. You stack a lot of them to enlarge the capture area, which is
required to capture all the signals at the point of focus.

>> Except maybe to someone in 1900, who did not understand it fully.

No, the problem is that I do understand how those circuits work and
you don't. Then you fall back to what was written in 1889 instead of
looking at the design with today's knowledge.

A reflected wave along a nonterminated transmission line will result in
doubled voltage at the open end.

> If yes, than you must admit that the leakage must be stronger at "recoil
> kick" when the voltage is doubled.
> "So there is the unsymmetrical flow of electrons." Do you agree?

But here you are talking complete hogwash again. The effect you describe
above has nothing to do with leakage or unsymmetrical flow of electrons.

Here you are the simple:
http://www.ac-grenoble.fr/yre/agency/library/missions/missrep1997/online/rap-nuc2.htm

Are the dipole elements symmetrical?
It seems that one of them is a counterpoise.
S*

Wiki says that a rectenna is "a dipole antenna with a diode connected across
the dipole elements".
A dipole is a balanced, symmetrical aerial and does not have a counterpoise.
I can't be responsible for you being unable to understand what
"symmetrical", "balanced" and "counterpoise" mean. I can suggest / recommend
that you acquire a reference book on aerials from the ARRL or RSGB. You'd
find them immensely helpful.
Regards, Ian.

Why? I see symmetrical elements.

What you can also see here is that this is another example of what
I wrote earlier: there is a circle in the schematic starting at the
diode where you can go around with DC current and end at the same
point.
This circle is where the DC current flows, not from the elements into
the air.

Not always. The "nonterminated transmission line" may be the Lodge's wire or
Your antenna (short dipole).
In your antenna the electrons are not reflected and do not destroy your
transmitter. They JUMP OFF Periodically = pressure waves.
Do not write that I claim it. It is the explanation by Faraday, Lorenz,
Tesla and Dirac. The all is in the each textbooks. But in different chapters
(lessons).

In each textbooks is the Richardson equation. The electron field emission is voltage and temperature dependent.

Do you understand the Pointing explanation that nothing if flowing in the conductor?

For me: " But then later it was found that the first (Pointing) discoveries were not
entirely correctly described."

I see that the voltages are not symmetrical when the diode shines.
I bet that is the such orientation vs a oven that is the symmetry and no
shine.

From Maxwell's time all circuits are closed. So sometimes the current must
flow in the air. Of course sometimes is enough if only part flows in the
air. It is the leakage.
At HF the leakage is rather large.

Maxwell did not believe in current flowing "in the air". That's why he used the concept of "displacement current". He was ignorant of photon energy flow being the equivalent of current flow. Nowadays, we know that when it appears that coherent current is flowing in the air or indeed through any dielectric (including free space), it is actually photons that are doing the flowing, i.e. photons are accomplishing the energy transfer *as if* current were flowing through charge carriers. All EM field/wave phenomena involve quantized photons.

For those who still believe in displacement current, it is easy to prove that, under certain conditions, the displacement current would have to violate the speed of light limit in order to accomplish the energy transfer in the measured time.

> Do you understand the Pointing explanation that nothing if flowing in
> the conductor?

Quoting "Fields and Waves ...", by Ramo & Whinnery: "A perfect conductor is usually understood to be a material in which there is no electric field at any frequency. Maxwell's equations ensure that there is then also no time-varying magnetic field in the perfect conductor."

In the non-perfect real world, something is flowing in the skin effect depth of a conductor which is the cause of the power losses in the conductor.

The whole XX century was the century of intensive egzamination/explanation
of the field electron emmission.

If not in your antenna than you should be able to explain what the electrons
do in your antenna if they are not reflected (VSWR = 1).
Do you try?

> (maybe this evening they will, thunderstorms announced. but not because
> of transmissions)

Your antenna goes into receiving.
But I do not know if the electrons are injected into your antenna.
Are they?

No, it was the century of examination of elecromagnetic radiation; antennas
have nothing to do with field electron emmission as field electron emmission
is a result of electrostatic fields and antennas work on electromagnetic
radiation.

> If not in your antenna than you should be able to explain what the electrons
> do in your antenna if they are not reflected (VSWR = 1).

The electron in any antenna flow back and forth between the antenna terminal.

There are no electrons either jumping off of or onto an antenna.

This is a figment of your imagination.

VSWR has nothing to do with electrons and everything to do with
elecromagnetic fields.

> Do you try?

Try what?

Electrons may be injected into an antenna by a lighning strike, but that
has nothing to do with how antennas work.

> Are they?

No, not other than by a lighning strike.

In vacuum they flow without sparks. They flow at low voltages (10V) and the
cold cathode. In air is the same.
Do you like such?

I don't dislike electrons and have a bunch of them in my body. Without free electrons, antennas wouldn't be able to radiate photons.

> For what you need the next " the equivalent of current flow".

Technically, current is defined as the movement of charged particles. Since photons don't carry an electric charge, they technically don't meet the definition. But since current flow implies energy transfer and photons are capable of energy transfer, one can come up with the concept of "equivalent current" corresponding to photon movement. Thus the "current flow" through a capacitor is explained by photon flow rather than displacement current.

Not all antennas have ends so your question is basically meaningless.

For those antennas that do have ends, the voltage and current distribution
depends on the length of the antenna in terms of wavelengths and can be
anything.

On Friday, July 27, 2012 12:50:32 PM UTC-5, Szczepan Bialek wrote:
> Are the voltages doubled at the ends?

The voltage doubling at the ends of a dipole is simple to understand. A dipole is a standing wave antenna. When the forward wave from the feedpoint encounters the open-circuit at the end of the dipole wire, a reflection takes place where the reflected voltage is in phase with the forward voltage and the reflected current is 180 degrees out of phase with the forward current.

At the end of the dipole, |Vfor|=|Vref| and |Ifor|=|Iref|. So the total voltage and total current at the ends of a dipole are:

Vtot = Vfor + Vref = 2*Vfor = 2*Vref

Itot = Ifor - Iref = 0

And of course, no current is going to flow into the open-circuit at the end of the dipole so the total energy in the magnetic field at that point is zero.

All of the energy in the EM waves migrates to the electric field and that's why we get a standing wave voltage maximum at the ends of a 1/2WL dipole.

However, under certain corona conditions, when the impedance at the end of the dipole conductor is much less than infinite, electrons actually migrate from the antenna into the conductive air, e.g. salty fog on the coast. But this is undesirable non-coherent behavior unless you are building a Tesla coil.

I once saw a mobile antenna emitting a red corona glow in the fog on HWY 1 near Monterrey, CA. A traffic cop stopped him for having a "red light" that could be seen by oncoming traffic.:)

"Energy transfer": "Umov was the first who introduced in physics such basic
concepts as speed and direction of movement of energy,".
" In his first works of this period, Umov considered potential energy as
kinetic energy of some environments "imperceptible for us"."
From: http://en.wikipedia.org/wiki/Nikolay_Umov

Photons as the wave packet transfer the energy in the same way as the sound
waves.
In radars are "pulses". Light is not coherent. It consists of pulses or
photons. The same is in sonars.

For what you need the new "photons".

Good morning Szczepan.
Sound waves propagation through a gaseous medium. No medium - no sound wave.

Light waves and radio waves can propagate without a gaseous medium.
Please get a textbook and read some theory. If you choose to say, once
again, that textbooks are for children then do remember that children can
learn and understand.

Regards, Ian.

You assume that there no field electron emission. Why?

>All of the energy in the EM waves migrates to the electric field and that's
>why we get a standing wave voltage maximum at the ends of a 1/2WL dipole.

Nobody know what the EM waves are. Write about electrons.

>However, under certain corona conditions, when the impedance at the end of

They migrate if the voltage is:
"Field emission was explained by quantum tunneling of electrons in the late
1920s. This was one of the triumphs of the nascent quantum mechanics. The
theory of field emission from bulk metals was proposed by Ralph H. Fowler
and Lothar Wolfgang Nordheim.[1] A family of approximate equations,
"Fowler-Nordheim equations", is named after them."

>I once saw a mobile antenna emitting a red corona glow in the fog on HWY 1
>near Monterrey, CA. A traffic cop stopped him for having a "red light" that
>could be seen by oncoming traffic.:)

Each your antennas are the electron emitter:
"How would the ideal field emitter look like? It should be very long and very thin, made of conductive material with high mechanical strength, be robust, and cheap and easy to process". From:
http://ipn2.epfl.ch/CHBU/NTfieldemission1.htm

The voltage doubling is only theoretical. In reality the voltage is rising to the level necessary for effective field emissions.
If no proper voltage no radiation.

> You assume that there no field electron emission. Why?

Please don't tell me what I am assuming because you are invariably wrong. As I (and Richard Feynman) have told you before, the fields emitted by electrons consist of photons. Electrons escaping a transmitting antenna are a non-coherent corona discharge. Photons escaping a transmitting antenna are coherent RF energy.

Back in the early 20th century when spark gap transmitters were being used, the spark gap function, like lightning, generated non-coherent photons which filled the RF spectrum. Nowadays, a CW signal is mostly coherent with a small amount of non-coherence associated with the transient rise and fall times.

You have the misunderstanding that the current on the outside of the
coax cable is the result of electron emission by the antenna. This
is of course not true. It is the result of imperfect symmetry or
imperfect balun operation.

"Electric currents that oscillate at radio frequencies have special properties not shared by direct current or alternating current of lower frequencies. The energy in an RF current can radiate off a conductor into space as electromagnetic waves (radio waves); this is the basis of radio technology."

As you see something radiate off a conductor into space. So the something must be in the space.
Are such issue (special properties) for children?

All natural sources produce the damped waves. They are not coherent at all
frequences.
Only today radio transmitter and free electron laser are able to produce
undamped waves.

For Planck and Einstein that wave packets were the portion of energy. The
name photon have many definitions.

Because there isn't any because field electron emission is caused by
an electrostatic field and antennas have electromagnetic fields.

You have been told this several times; why do you continue to ask the
stupid question?

>>All of the energy in the EM waves migrates to the electric field and that's
>>why we get a standing wave voltage maximum at the ends of a 1/2WL dipole.

Not all antennas are either long or thin; loop antennas work just fine.

> The voltage doubling is only theoretical. In reality the voltage is rising
> to the level necessary for effective field emissions.
> If no proper voltage no radiation.

This pure, babbling, nonsense.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how anything works.

You don't even understand what an antenna is or the difference between
an electric field, a magnetic field, and an electromagnetic field.

Electrostatic and magnetostatic fields are created by DC.

An antenna is a device that converts the AC electrical energy at its
teminals into electromagnetic energy which radiates from the antenna
and also coverts the electromagnetic energy which antenna intercepts
into AC electrical energy at it's terminals.

That is ELECTROMAGNETIC energy, not magnetostatic nor electrostatic
energy.

How many antennas have you built in your lifetime?

Why do you refuse to answer the question?

Is it because you have built zero antennas and you are trying to say all the people that have successfully built hundreds that they are all wrong and you don't want to admit you are an ignorant, inducable, idiot?

Why can't you obtain and read a university level textbook on anything in any language?

Is it because you are too stupid to be able to understand the material?

You have no clue what the word "damped" means, do you?

The Sun, which is a natural source, does not produce damped waves.

Being damped and being coherent are two independant properties.

> Only today radio transmitter and free electron laser are able to produce
> undamped waves.

Wrong again because you have no clue what the word "damped" means; almost
EVERYTHING produces undamped waves.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how anything works.

Why can't you obtain and read a university level textbook on anything in
any language?

Is it because you are too stupid to be able to understand the material?

However, since you have no understanding of anything, you would be better
to start with a grade school textbook as your knowledge is that of a
five year old.

Wrong again, moron.

AC means Alternating Current as opposed to DC or Direct Current.

RF means Radio Frequency and is generally used to the AC that is being
received by a receiver or transmitted by a transmitter.

None of these terms has anything to do with open or closed circuits.

You are an ignorant, babbling, ineducable idiot who knows absolutely
NOTHING about how anything works.

Where ever you got this piece of trash quote, it is wrong just like all
your ancient quotes from over a hundred years ago.

AC of any frequency can radiate off a conductor into space as
electromagnetic waves.

> Now are also ULF transmitters (30Hz). So the above is not precise.
> What decide that "an RF current can radiate off a conductor into space"?

That the AC is applied to an appropriate antenna.

That is the purpose of an antenna, to convert AC into electromagnetic waves.

For the third time, AC of any frequency can radiate off a conductor into
space as electromagnetic waves.

There is no minimum frequency.

Hello Szczepan.
"> The condenser also radiate? "
Try asking on sci.physics.electromag. If the diagram is trying to equate a
capacitor to an antenna then I'd not agree with that at all.
"> What the appropriate antenna looks like?"
It would be an antenna that matches to the transmitter. You wouldn't use an
antenna that is a mismatch as this would defeat the purpose of the antenna.
"> Is an antenna the open circuit?"
From my viewpoint it is not. "Open circuit" = "no current" and we know that
antennas carry a current.

Several postings have recommended that you acquire a textbook. I have a
suspicion that you already have one ....

Regards, Ian.

It is known from Hertz experiment. He used plates or balls.
Of course the plates are as on the diagram.

No.

This depicts electorstatic fields; antennas radiate electromagnetic
fields, so your question makes no sense.

>>> Now are also ULF transmitters (30Hz). So the above is not precise.
>>> What decide that "an RF current can radiate off a conductor into space"?
>>
>> That the AC is applied to an appropriate antenna.
>
> What the appropriate antenna looks like?

It makes no difference what the antenna looks like as the only property
that matters is its ability to convert AC electrical energy at the input
frequency to electromagnetic radiation.

>> That is the purpose of an antenna, to convert AC into electromagnetic
>> waves.
>>
>> For the third time, AC of any frequency can radiate off a conductor into
>> space as electromagnetic waves.
>>
>> There is no minimum frequency.
>
> Is an antenna the open circuit?

No.

An antenna is a device that converts the AC electrical energy at its
teminals into electromagnetic energy which radiates from the antenna
and also coverts the electromagnetic energy which antenna intercepts
into AC electrical energy at it's terminals.

Do you wear slip on shoes?

Rather solitons.
Photons are the damped waves.
CW consist of the solitons.
Each portion of electrons which jump off from the end of an antenna travel
as the soliton.

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

Unfortunately for your argument, the fact that fields/waves are quantized proves that they are particles, even though they are a somewhat special kind of particle and capable of field/wave behavior. Hint: if you set up an experiment to look for a quantized photon particle, you will detect a quantized photon particle the energy of which is related by frequency to Planck's equation.

http://employees.oneonta.edu/viningwj/sims/plancks_equation_s.html

FYI, even one single Bucky-ball, known to consist of nothing but a large number of carbon atoms, is capable of wave behavior. How do you explain that one?

Hello Rob.

As others have said, and a search confirms, Szczepan has been posting some of his ideas for a year or more. Seems unable to read, understand and learn whereas most children with a textbook are capable of reading, understanding and learning.
I think I have worked with only one person who refused to learn new ideas and techniques. His work involved using a new computer. I showed him how to use it and then let him try to get on with the job. Eventually he did become willing to have a go. He now seems progressive in comparison with Szczepan.

73, Ian.

All time the ideas are the same and are confirmed:

"It is found that an electron which seems to us to be moving
slowly, must actually have a very high frequency oscillatory motion of small
amplitude superposed on the regular motion which appears to us. As a result
of this oscillatory motion, the velocity of the electron at any time equals
the velocity of light." From:

No, you are the only one in the world that currently believes electrons
jump off the end of an antenna.

It was later shown and proved that it is impossible for an electron to
move at the speed of light under any conditions.

That's what you get when you only read ancient literature.

Do you wear slip on shoes?

Electrons that "jump off" a transmitting antenna are known to be non-coherent. Such is called "corona", an undesirable effect for antennas. The coherent particles that can be measured being emitted from an antenna are photons and that's NOT a new hypothesis. It's close to being a century old. Einstein was awarded the Nobel Prize in 1921 for discovering the nature of the photoelectric effect of photons.

electromagnetic waves could only exist in these discrete wave-packets.[5] He
called such a wave-packet the light quantum (German: das Lichtquant). "

"As shown by Albert Einstein,[5][38] some form of energy quantization must
be assumed to account for the thermal equilibrium observed between matter
and electromagnetic radiation; for this explanation of the photoelectric
effect, Einstein received the 1921 Nobel Prize in physics.[39]"

"Hence, Einstein's hypothesis that quantization is a property of light
itself is considered to be proven."

Natural light is emitted from many oscillators in discrete wave-packets.
Hertz made the one oscillator which radiate the discrete wave-packets. The
Hertz waves are exactly as the light.
But the CW are emitted continuously.
Who was awarded the Nobel Prize for discovering any portions in CW?

And that light quantum is known today as the photon to everyone but you.

All a bunch of gibberish nonsense; all electromagnetic radiation is photons.

There is much more energy in one visible light photon than in one RF photon. The fact that photon energy varies directly with frequency blows your "jumping electron" theory right out of the water, i.e. recognized as a scientific myth by all rational technical people since long before any of us were born. "Electrons jumping off an antenna" is akin to the theory of a flat earth at the center of the universe. Do you still believe that one?:)

If and when an electron leaves an antenna, it ceases to be exposed to the RF energy that is causing it to vibrate and *becomes like any other electron floating in space* - devoid of frequency and oscillations - incapable of propagating a coherent RF wave. Photons have no such limitations.

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:
```

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

"Leaping" fits to the oscillatory flow:
""It is found that an electron which seems to us to be moving
slowly, must actually have a very high frequency oscillatory motion of small
amplitude superposed on the regular motion which appears to us. As a result
of this oscillatory motion, the velocity of the electron at any time equals
the velocity of light." From:

Considering the overall volume of postings here and the fraction of
world population that the Poles are, I don't think it is statistically
surprising that you see only a single Pole here.

Hello Rob.

Well, I'm thinking that where there is one then there will probably be
others. Perhaps the postings by Szczepan deter other Poles from posting.
73, Ian.

But even I am not the poster. I only "copy and paste".

So the real posters are: Faraday, Lorenz, Tesla and Dirac.

They are using the words "oscillations" and "vibrations".
Wayne used the "leaping". It is also not precise.

In the antenna are the unsymmetrical oscillations like in the water waves:

Hello Szczepan.

Actually, yes, you are the poster. You copy and paste and post. The problem
is that you often don't understand the meaning / import of the text which
you are copying and pasting and posting nor do you learn from the postings
made in reply to you.

Regards, Ian.

Makes me think back to an old joke from EE at college involving Poles,
zeros and the right half of the (air)plane.

And I am Polish so I can make fun of my heritage. Our last name was
quite different when my grandfather moved to the US.

So we have the three teams of posters:
1. Faraday, Stokes, Lorenz, Marconi, Tesla and Dirac,
2. Heaviside and Poynting,
3. You, Tom, Rob and Jimp.

From whom should I learn?

Do you know:
""Poynting and the Nobel prizewinner J. J. Thomson co-authored a
multi-volume
undergraduate physics textbook, which was in print for about 50 years and
was in widespread use during the first third of the 20th century.[5]
Poynting wrote most of it.[6""

For example in the textbooks the water waves are "transversal" and the space
is empty.
In the above link you can see that the water waves are longitudinal.
Have the stars the atmosphere?

Unfortunately one is in the left half of the plane and the other in the right half of the plane so we are a bit lacking in stability.

Do you agree with Heaviside and Poynting. Father of the famous vector wrote in 1884 (before the Hertz experiment):

""Energy is transferred through empty space outside the wires".
"The whole of the energy then enters in through the external surface of the wire, and by the general theorem the amount entering in must just account for the heat developed owing to the resistance,"

As you should see the energy from the transmitter enters in through the external surface of the
wire (antenna) and next is radiated as the heat.

It amuses me. And what about you?
Do you know that antennas radiate very,very lower frequences than heat?

"'How does energy really flow in electric circuits?'. The answer is fairly standard university-level physics but is rarely mentioned in secondary school text books".

What textbooks you have?

> "'How does energy really flow in electric circuits?'.

The coherent RF energy flows near the surface of the conductor at the speed of light in clouds of photons. Given the magnitude of the Poynting vector, we can calculate the number of photons passing through that area in unit time. Those coherent photons that extend into the inner surface effect area have the highest probability of their energy being converted into infrared higher energy photons, i.e. heat radiation. After all, RF photons cannot exist for long deep inside a real-world conductor and they cannot exist at all inside a zero resistance conductor. Here's a question for you: How many 10 MHz photons does it take to generate one infrared photon?

Only steady-state DC doesn't involve photons. All AC, RF, and transient DC functions involve photons and that has been accepted as scientific fact for about a century. Unfortunately, the physicists being quoted by you were completely ignorant of the existence of photons.

Hello Szczepan.
I am a licensed radio amateur and I am concerned with matching my aerial to my transceiver. I'm personally not at all concerned about any heating effect, theoretical or actual. Sounds like a topic for one of the physics newsgroups.
As for textbooks, I have a shelf of them. You'll remember the recommendations I made in other posts.
Regards, Ian.

Your babbling?

Yes, it is amusing how you are always wrong.

> Do you know that antennas radiate very,very lower frequences than heat?
```

If by "heat" you mean infrared, then yes, standard radio frequencies are
much lower than the frequency of infrared light, but you only got that
correct by accident.

> "'How does energy really flow in electric circuits?'. The answer is fairly
> standard university-level physics but is rarely mentioned in secondary

In the secondary school level are electrons.
In university level are the all theories including "proved incorrect or incomplete".
Students should know all of them.

>
>> What textbooks you have?
>
> Lots; all university level and all read.

So try to pick up the theorirs which are "proved incorrect or incomplete".

The first should be Heaviside's and Poynting's.

I don't have time to look up a lot of quotes but you can Google them for yourself:
Albert Einstein, Niels Bohr, Erwin Schrodinger, Werner Heisenberg, Max Born, Wolfgang Pauli, Richard Feynman, et. al.

Babbling gibberish.

A secondary school education provides an overview of a subject.

A university education provides the fine details of a subject.

2217. Crossposting Permitted to rec.radio.amateur.moderated

Newsgroup: rec.radio.amateur.antenna
Date: 2012-08-15 06:00:03 UTC
From: rram@panix.com
Message-ID: <radio/ham-radio/moderated/crossposting-1-1345010401@panix.com>
Source record: 984
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.info

```
Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.2 2011/11/02 04:08:53
Posting-Frequency: posted twice monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

2219. DSP software for using sound card audio strength to compare antennas?

Newsgroup: rec.radio.amateur.antenna
Date: 2012-08-16 16:25:12 UTC
From: TF3KX <kristinn1@gmail.com>
Message-ID: <4362fb9f-b48e-4f00-a051-1528dd8a44b1@googlegroups.com>
Source record: 986

Hi everyone:

I am about to compare the performance of two HF antennas and have an idea for doing this, that I would appreciate comments on.

The objective is to determine which antenna yields a stronger signal to DX locations, and even get a measure of the difference in dB. I am assuming that the antennas are reciprocal, so if antenna A receives an X-dB stronger signal than antenna B, antenna A will also yield an X-dB stronger signal from my transmitter to that location. So, I would like to measure the signal strengths received through these antennas and compare them. For this I would listen for CW or digital mode signals, switch back and forth between antennas, turn off the AGC and record the audio into a file (or monitor it directly), where I could accurately estimate the signal strengths and compare. I realize that different noise levels, fading, intermittent signal transmission, etc. will affect the absolute signal levels, so the software should be able to handle this. For example, by measuring the signal carrier alone and/or SNR. And it would be nice if the software could give me an "envelope reading" of the signal, for example, to estimate the CW signal.

Do any of you have comments on this methodology to compare antenna performance? And do you know of any DSP / sound card software that could be used for this?

73 - Kristinn, TF3KX

Free, made for ham radio, and possibly better:
<http://www.qsl.net/dl4yhf/spectra1.html>
<http://www.weaksignals.com>

When using detected audio to compare antennas, make sure you're
comparing signals, not comparing noise levels. Picking up more
atmospheric noise is not the mark of a better antenna.

Actually, I have been in a hotel room with something similar. Well, the earth wasn't actually a cup of earth but the wires were coming out of the wall. Ah well, if you know they are wires then you'll also know to be very careful with them (especially in a damp bathroom). If you don't know they are wires then you'd probably not be in a hotel in the first place?

Posting-Frequency: posted twice monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:
```

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

resonant antenna [ˈres·ən·ənt an ˈten·ə]
(electromagnetism)
An antenna for which there is a sharp peak in the power radiated or intercepted by the antenna at a certain frequency, at which electric currents in the antenna form a standing-wave pattern.

McGraw-Hill Dictionary of Scientific & Technical Terms, 6E, Copyright © 2003 by The McGraw-Hill Companies, Inc.

I thought a resonant antenna was resistive without any reactance.

> I thought a resonant antenna was resistive without any reactance.

Consider a transmission line with standing waves. There is a point every 1/2WL where the impedance is a low "resistance without any reactance". That is the point where the standing wave voltage is in phase with the standing wave current. A 1/2WL dipole is a standing wave antenna with an SWR on the antenna of approximately 20:1. At the center feedpoint, the standing wave voltage is in phase with the standing wave current so the feedpoint impedance is "resistive without any reactance".

If you look at the current and voltage distribution on a standing wave antenna you will find that it looks just like the current and voltage distribution on a transmission line with reflections.

Hello, and resonance for an antenna (or any device for that matter) occurs when the reactive component of the input impedance vanishes. For a given impressed voltage, the input current is relatively large at resonance. The definition cited above is completely consistent with this state (Did you really think something from a McGraw-Hill book wouldn't be a "proper" definition?)

Now, we also have "antiresonance" in which the reactive component also vanishes but for a given impressed voltage the input current is relatively small.

Both resonance and antiresonance occur in antennas (but at different frequencies). Sincerely, and 73s from N4GGO,

The standing waves will exist whether resonant or not.

At 14.32 MHz a certain dipole accepts 159.2w from a 100v source into a resonant 62.8 ohm feedpoint impedance. At 14.25 MHz, it accepts 160.2w from a 100v source into a non-resonant 61.9-j6 ohm feedpoint impedance. So it appears that you are technically correct but maybe splitting hairs.:)

Seems that these conditions would also exist for any conjugately matched non-resonant standing-wave antenna.

You just showed that the off-resonant antenna accepts *more* power than
the resonant one. That is not a "sharp peak."

You used a fixed 100V source. If you can do that, I can use a fixed 1A source. In that case a resonant antenna of 62.8 ohms feedpoint resistance will radiate very nearly 62.8W. An antenna with a feedpoint impedance of 62.8 + j50 will radiate very near 62.8W.

There is no sharp peak in the power radiated whether at resonance or not. The definition as it stands is incorrect.

Let's modify the definition until you agree with it. How about?

resonant antenna [ˈres·ən·ənt an ˈten·ə] (electromagnetism)
An antenna in which there is a peak in the standing wave energy on the antenna at a certain frequency during receive when configured as an unloaded parasitic element using a constant power, variable frequency source for the incident RF fields.

Would you agree that that energy peak indicates antenna resonance?

Only a perfect person never makes an incorrect statement.

I gave an example where that definition applies to a conjugately matched non-resonant antenna. Of course, all conjugately matched antenna *systems* are resonant whether the antenna is a resonant or non-resonant length. Seems that definition has the same flaw as in Reflections, by Walter Maxwell (SK). Where he said, "My antenna tuner really does tune my antenna", he probably should have said, "My antenna tuner really does tune my antenna system." The definition should IMO also eliminate the word "sharp" from the definition. A resonant 1/2WL dipole does have a peak but it isn't sharp because of the broad bandwidth.

The definition of a "resonant antenna" *should* exclude non-resonant antennas just as the definition of a "red car" should exclude non-red cars. A non-resonant antenna that is conjugately matched meets the definition of a resonant antenna. That seems to be ambiguous at best and at worst, a contradiction. Updating the definition:

resonant antenna (also applies to a conjugately matched non-resonant antenna) -
An antenna for which there is a peak in the power radiated or intercepted by the antenna at a certain frequency, at which electric currents in the antenna form a maximum current standing-wave pattern

So much for the myth that resonant antennas radiate better than non-resonant antennas. Consider the following two examples without transmission lines.

50 ohm Source---50 ohm load

100+j100 ohm Source---100-j100 ohm load

Which system has the most efficient power transfer efficiency?

Has anyone ever considered that if the coax is disconnected from a center-fed half-wavelength antenna, the antenna is no longer resonant and could instead be used for a non-resonant guy wire at that frequency?

The traditional approach is to use glazed ceramic insulators, I
believe.

Such a problem is going to come from one of two things:

Too much power for too little separtion and arcing; use wider spacing and
less power.

Accumulated filth and moisture leading to leakage leading to carbonization;
heat shrink tubing or tape like Coax-Seal to keep the path clean and dry.

I'll leave the specifics of your question to the experts.

But, worth mentioning is that once you have selected a material, plop some
in a microwave along with something like a a container of water. Then see
if your insulating material stays cool.

Assuming power of about 1 kW and a HW dipole (say 60 Ohms), the
voltage will be about 350Vp. I can hardly imagine that a plastic gap
of 0.05m will degrade to failure because of tracking.

Make sure you have UV resistant rods, and/or add some layers of UV
resistant (marine quality) coating.

Actually, a material can be perfectly fine at microwave frequencies and bad at HF. And vice versa. The microwave oven test should only be considered a *very rough* indication of material suitability.

HF, or more likely, not.

tom
K0TAR

I'm sticking with the test being relevant at HF.
A material that does not heat up at microwave, would be unlikely to heat up
at HF.

At any rate, the test can be done for free.

On the other hand, if the original poster is attempting to drive this antenna off-resonance, with open-wire feedline and a wide-impedance-range transmatch / "antenna tuner", then it's entirely possible that the feedpoint will sometimes be "looking into" a much higher impedance, and that a matched drive will result in very high voltages at the feedpoint. Even a coax-feed antenna might have this problem, I suppose, if the split element is being driven by something like a delta match which has a relatively high impedance-transformation ratio.

From what I see in a short Google-search, fiberglass *can* be hygroscopic, depending on what resin was used to bind the fiberglass. A fiberglass rod which was made with a somewhat-hygroscopic resin (e.g. polyamide) might tend to behave badly in the face of high RF voltages, whereas a rod made with a non-hygroscopic resin might be fine unless dirty or wet.

Hello Dave,

Thanks for de addition. During the simple voltage calculation my mind
said: "what if VSWR is really bad".

With 1 kVp over 0.05m I would not expect problems. You are right,
Polyamide (Nylon) is bad for RF and as far as I know, isn't fully UV
resistant without additives.

Once I had a nylon bolt in the field of a tuning capacitor running
close to breakdown over about 3mmm. The bolt produced lots of smoke
within some seconds and broke down. Changing from PA to PE solved the
problem.

Assuming 50% glass fill factor and effective loss factor of 0.2 (so Q of the glass/PA composite material is just 5), I would expect a dissipation in the range of 4 Watts at 1 kVp and 10 MHz in a 1.5 Inch thick massive rod. Maybe Kba can provide us some additional info on the working voltage across the gap (and frequency).

When using epoxy or polyester fiberglass, loss will be significantly less.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may

2258. My 80 meter loop antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2012-09-01 15:08:34 UTC
From: Boomer <boomer@nospam.com>
Message-ID: <Gxp0s.381470$xK2.214842@en-nntp-11.dc1.easynews.com>
Source record: 925

I have had an 80 meter loop running around my house at a height of 35 feet now for 5 years. It was fed with a 75 foot section of 450 ohm window line. This served me well during this time. I know very little of antenna theory. I do know some electronics and repair my own transceivers and amplifiers.

I wanted to do a little improvement to this loop to stop the thing from changing tune every time it rained or snowed.

A fellow ham urged me to use open wire 600 ohm line to stop this detuning from happening and to improve my losses with this antenna.

I already felt I had a pretty good antenna because it really lowered my receiver noise over a dipole that I had originally. Anyway, two days ago I finally did the work to put up a 600 ohm line using #14 insulated house wire and spacers from www.73cnc.com.

I was shocked to see my antenna change tune radically. I thought I had made a mistake and was going to have to replace the open wire line with the 450 again. I was worn out after the day of changing this line. So I spent the next day using the antenna anyway. My VSWR on 75 meters had gone from 3 to 8. Yikes. However, all the higher bands looked a lot better. 15 and 10 meters showed an almost perfect match. The antenna became much quieter. My friends on 75 said they heard no difference in my signal strength even with the 8 to 1 VSWR.

I have an Imax 2000 that I use for 15 and 10. This antenna always showed an increase in signal strength on those bands over the loop. Now the reverse is true. I hear signals on the loop that are buried in the noise on the Imax. In 1 short hour I worked Cuba, Belfast, Nurenburg, and California getting great signal reports from them all and seeing beautiful S meter readings from them.

I cannot explain this effect with any kind of theory. I simply don't know antenna theory. But it happened. My friend cannot explain it either but he tried using open wire feeds 30 years ago and will not use anything else.

Thanks for all comments, ... some new approaches have arisen... to
eliminate possible risks and troubles before they exist...

This problem is dual, both electrical and mechanical as insulator in the
element gap is under quite high mechanic stress...
This is future OWA antenna split driven element... will be used at HF...

This previous fiberglass problem wasn't instant, it developed slowly
after several years of succesful use (and weather effects, moisture
etc.) so probably the reason was only the moisture, dust and dirt
layers in the inner surface of the insulator.
Insulator was round fiberglass tube of 65mm diameter and around one
meter long, used as center of 7MHz antenna feed element (60mm diam.),
the outer surface of the tube was weather (and UV) protected and water
proof, but the 5 cm gap inside the tube was not entirely though element
ends were not in open air... some moisture do condensate always inside
the element... I guess...

Measured impedance was quite low, 25 ohms resistive near resonance, so
probably voltages have been also low at one kw power level.

I cannot tell the exact fiberglass grade that was used, probably it was
green FR4 or other strong quality as mechanical stress was high in the
insulator and long and heavy 7MHz element halves loaded the insulator
center.
This fiberglass insulator tube finally got to a ohmic short and didn't
recover.

Later this insulator was replaced with another type and problems
disappeared.

. . .

Now one other future split driven OWA antenna has been under plan ...
but there are the same mechanical stress problems as element center gap
should (?) have center support rod but it exposes also to all weather
effects... in this case element diameter will be 25 mm...
So insulation in the gap should be good but material should be also
something capable handling bending moment of the element halves...

Now the latest plan is try to move the mechanic load away from the
center support rod to element support plate which could be much longer

in length... then the element center stress is expected to be lower across the gap...

Then also the element clamps have more separation as this support plate is also again FR4...
Secondly the element halves will be insulated from the clamps so there will be less risk of this FR4 plate becoming conductive...
Insulation between element and clamps could be thin straps of teflon sheet...

Best might be if the fiberglass center support rod can taken totally out or be of round teflon bar... good insulator, low friction, probably air particles etc. don't stick on it easily...

Teflon feels tough but elastic, so in the stress point it's not much use, but probably functions as a vibration damper in the gap... assuming the element support plate does not transfer element end bending effects due to wind load directly to element center gap...

Anyway it's going to be interesting to see how these precautions will actually work... in both at mechanical and electrical reliability... hopefully in both.

In a past life, I helped design marine radios. As others have
mentioned, there are different flavors of fiberglass, some of which
are not really suitable for outdoor or high humidity applications.

Instead of trying to fix fiberglass, you might consider machinable
glass ceramics.
<http://www.matweb.com/Search/MaterialGroupSearch.aspx?GroupID=301>
Something like material:
<http://www.matweb.com/search/datasheet.aspx?matguid=848bdecf89b74ef986925162e6a6255e&ckck
=1>
<http://www.corning.com/assets/0/965/989/1081/1397D5E7-018E-4CF4-A34C-6814B815BCAC.pdf>

It's sufficiently strong to handle antenna elements, but was also
somewhat brittle. RF characteristics are superb. 9.4Kv/mm is not
going to arc. However, you won't like the prices. A 1" dia 6" long
rod will cost you $150.
<http://www.astromet.com/MacorPriceSheet2010.pdf>
For ham radio, nothing but the best.

Otherwise, there's always the traditional dry pine dowel soaked in
bees wax.

Well, hmmm...
There seems to be several alternatives to fiberglass... and several
grades of it...

Just thinking of how glass ceramics may behave under bending force...
Element center gap is under very small vibration (wind load) and element
static load stresses the insulator center... it bends slighly depending
how elastic is the material...
Fiberglass have some elasticity... it's not brittle... on the other hand

there could be support limiting the bar bending or the element halves
might have more than two clamping points... so the center gap would
be steady...

Actually I had in mind using extra varnish layers on fiberglass after
processed to diameter and then boiling it in bee wax...
This is still the plan b or c.

Tracking (forming of conductive (carbon) path) is mostly a slow
process that may take years to develop to failure, so this sound
strange (if creepage is the root cause).

This changes the story when moisture can enter the inner side of the
tube and may stay there. I assumed you used a massive rod for
mechanical strength. At the inner side you don't have the cleaning
effect due to rain, wind, precipitation, etc. Could there be salt
built-up (due to seeping water that evaporates slowly)?

You mentioned it is 1 m long, that is really a large creepage
distance! Assuming about 5mm wall thickness and fully conducting
inner side of the tube, radial field strength (350V) will be in the
50V/mm range, well below permissible levels to avoid insulation
failure at MHz frequencies in FR4 material.

It would be nice to inspect such a failed tube to figure out how the
tracking took place, because I have now idea.

Besides mechanical cracks that may provoke solid insulation breakdown, carbon trace forming (tracking) over wheather exposed plastic surfaces is the most likely problem, so I think you should try to maximize the creepage path. As E-field strength in the insulation materials will be low, you don't need low loss materials.

Thanks for sharing the info on the insulator failure!

Machinable glass ceramic insulators don't behave... they break.
They're great under compression but miserable in tension. So-so in
torsion. All you have to do is make the insulator stronger than the
element it supports. If there's excess force on the element, the
aluminum element will bend rather than the insulator will break.

>Element center gap is under very small vibration (wind load) and element
>static load stresses the insulator center... it bends slighly depending
>how elastic is the material...

I don't expect wind vibration to be much of a problem. The forces are
rather small compared to a flock of overfed birds landing on the
elements or the wind blowing at hurricane force. With a brittle
insulator, an impact with a flying hard object is a real danger.

>Fiberglass have some elasticity... it's not brittle... on the other hand
>there could be support limiting the bar bending or the element halves
>might have more than two clamping points... so the center gap would
>be steady...

You haven't supplied any numbers or dimensions, can't do any
calculations.

I don't think you'll have much trouble with the static loads
(including the birds). The wind loading might be a problem depending
on design.

Bees wax won't work on fiberglass.

>tnx oh6io

Perhaps if you build something really disgusting errr... innovative,
which balances some of the tension on the insulator with a little
compression, try building the yagi elements using wires instead of
tubing using a "cage". The "cage" will increase the effective element
diameter (thus increasing the antenna bandwidth). The "cage" will
also supply some tension to the insulator, which will balance some of
the tension.

I have a similar antenna at 35 feet, except is it a 160 meter loop fed
with 225 feet of 600 ohm feed line. I use a Dentron MT-3000A antenna
tuner with a built-in balun.

I tune the tuner using a MFJ 259B and get almost 1-1 SWR on all bands
through 6 meters. On some bands and at some frequencies, the tuning is

very narrow band. Particularly on 75 meters. If you are not using something like an antenna analyzer, you may be missing the correct spot for a 1-1 SWR.

Also, I always have to adjust the tuning for moisture, even here in the desert. Rain, ice and snow have a big effect.

The other side of the picture is the antenna really loves thunder storms and precipitation static. I have a big DPDT switch to open the feed line to the tuner and ground it directly. sometimes 1/4" arcs! You probably have already discovered this!

I love my loop! Even work 6 meter E's and contests with it.

Hi Jeff

Ok, very good points... this design may need better tools I have in
hands for the stress checks...

But some numbers... 14MHz tapered element half, symmetric segments,
starting at center 47" (OD 1", ID 0.625"), 24" (OD 0.875",ID 0.619"),
44" (OD 0.75", ID 0.619"),36"(OD 0.625",ID 0.467") and tip 58.7" (OD
0.5", ID 0.494") AL 6082, element wall dimensions are somewhat on a
heavy side at the center segments... so is the weight a little...
Center gap 2" between element halves.

Currently planned support plate dimensions L 15.75" x W 7.87" thickness
0.393" FR4, element clamp positions 2" and 6.88" symmetric along plate
long side, so two clamps for each element half, plate located above
element for partial rain cover... Plate max size 19.6" x 9.8"...
Not yet processed, so no worries for changes...

Much appreciated if you have some dimensioning help for the center insulator diameter and length (minimum) handling the stress...

I may still need to consider FR4 bar covered with shrink tube, but ceramics are also on a map... but depending on support plate strength and bending at gap center (or between nearest clamps 2" off the gap center) there might be chance to forget whole center bar in the gap...

An antenna analysis program like EZNEC would have predicted those results. Since the SWR, Z0, and losses are different going from 450 ohm ladder-line to 600 ohm open-wire line, the 50 ohm SWR and impedance will be different at the shack. There's absolutely nothing to be shocked about - it's just relatively simple physics in action. Here's a transmission line calculator that might help:

http://www.vk1od.net/calc/tl/tllc.php

A free demo (learning) version of EZNEC is available at: www.eznec.com

Hi

Yes, thanks for good material analysis. It was really very odd to find
this kind of failure *can* occur as gap was large and the material was
good quality. Visually by eye there wasn't anything unusual in the gap
inner surface, maybe they had been visible by more accurate means. But
aging exists in all materials and other environments than dry and clean
air shorten time for problems.
Insulator structure must taken account too...
Now to avoid similar troubles takes some more planning, the next
insulator is smaller in diameter and element mechanical stress is also

much lower...

Its all to do with resonance. On either side of that the wire or antenna
element becomes either inductive or capacitive. This quantity is
usually called reactance (J) and dissipates no power.

> i cant figure.For
> weeks ive drawn dozens of sine waves on scraps paper but stiil cant

> claim is dead simple

A noise bridge is basically a comparator. It essentially compares a
known quantity with an un-known one. When the bridge is balanced the
known and un-known are equal in value. A calibrated capacitor should
indicate which direction any reactance lays.

It's easy to understand once one understands phasor (vector) math and the basics of wave reflection. For a dipole, just remember that the current reverses phase at the end of the element and the voltage doesn't. A dipole is a standing wave antenna, i.e. there are forward waves and reflected waves on each element. The feedpoint impedance of a dipole is (Vfor+Vref)/(Ifor+Iref), all phasor math. A resonant 1/2WL dipole has two elements, each 90 degrees long. If we pick the phase angle of Vfor as zero degrees for a reference, the reflected voltage will have traveled 180 degrees during its round trip and will therefore be 180 degrees out of phase with the forward voltage. Phasors that are 180 degrees out of phase with each other simply subtract so the voltage at the feedpoint of a 1/2WL resonant dipole is |Vfor|-|Vref|, using regular math. The reflected current will have traveled the same 180 degrees plus another 180 degree phase shift at the end of the element. That puts Ifor in phase with Iref so these two quantities simply add. Total feedpoint current = |Ifor|+|Iref|. So the resonant feedpoint impedance of a resonant 1/2WL dipole is:

Zfp = |Vfor-Vref|/|Ifor+Iref| = ~50-75 ohms at zero degrees, e.g. 50+j0 ohms

You say you understand why the resonant feedpoint is resistive so - so far so good? That part is relatively easy because the phase angle of the feedpoint impedance at resonance is zero degrees.

For a dipole that is shorter or longer than resonant, we have to use phasor math because the phase angles are something other than zero and 180 degrees.

For a dipole a little shorter than resonant: Vfor+Vref will have a negative phase angle. Ifor+Iref will have a positive phase angle. Zfp=(Vfor+Vref)/(Ifor+Iref) will have a negative phase angle, e.g. 100 ohms at -30 degrees, so the feedpoint impedance will exhibit capacitive reactance.

For a dipole a little longer than resonant: Vfor+Vref will have a positive phase angle. Ifor+Iref will have a negative phase angle. Zfp=(Vfor+Vref)/(Ifor+Iref) will have a potitive phase angle, e.g. 100 ohms at +30 degrees, so the feedpoint impedance will exhibit inductive reactance.

When the dipole gets to one wavelength long, the voltages and currents are once again in phase or 180 degrees out of phase and the feedpoint impedance becomes purely resistive once again. However, the extra 180 degrees in the reflected wave's round trip results in in-phase voltages and out-of-phase currents.

For 1WL dipole: Zfp = |Vfor+Vref|/|Ifor-Iref|, i.e. a very high resistive impedance, e.g. 5000+j0 ohms.

In the above posting, I mistakenly omitted some absolute value marks. For instance, the above 1/2WL resonant equation should have been:

Zfp = (|Vfor|-|Vref|)/(|Ifor|+|Iref|)

I apologize for that boo-boo.

Yeah, you apologize and that's good, because he asked for basic basics
and you respond with vector algebra.

He also wrote: "A dipole is a standing wave antenna, i.e. there are forward
waves and reflected waves on each element."
He should add that the antenna with the reflected waves do not radiate.

Seems you and I have a different definition for the word "basic". It is impossible to have a *BASIC* understanding of feedpoint impedance in standing wave antennas without having a *BASIC* understanding of phasor/vector algebra and a *BASIC* understanding of reflected wave theory. The great majority of hams do not understand those *BASICS* and that is the reason for their confusion. I do not understand the *BASICS* of modern automobile mechanics. That's why I take my vehicles to a dealership.

> He should add that the antenna with the reflected waves do not radiate.

:) The reflected waves, for a standing-wave antenna, are *on the antenna elements*, NOT on the feedline. A resonate 1/2WL dipole has an SWR of ~20:1 on the dipole elements. Reflected waves on a standing wave antenna radiate just as well as forward waves on a standing wave antenna. Both forward waves and reflected waves on a standing wave antenna are common-mode and they radiate equally well.

Here's a brain teaser for all. Assume a resonant 1/2WL dipole made from #14 wire at a height of 30 ft. Given: The characteristic impedance, Z0, of a #14 horizontal wire at a height of 30 ft. is calculated to be 600 ohms. The forward voltage on the dipole elements at the feedpoint is 100 volts. The feedpoint impedance of the dipole is 50 ohms.

What is the reflected voltage at the feedpoint? What are the forward current and reflected current at the feedpoint? What is the SWR on the antenna elements? What is the voltage at the tip ends of the dipole elements?

Anyone with a *BASIC* understanding of standing wave antennas will be able to answer those questions.

2280. Ringo Ranger Problems

Newsgroup: rec.radio.amateur.antenna
Date: 2012-09-04 22:52:38 UTC
From: Channel Jumper <Channel.Jumper.a8c4079@radiobanter.com>
Message-ID: <Channel.Jumper.a8c4079@radiobanter.com>
Source record: 947

Ok, so a friend of mine died, and at his SK auction, I picked up about 6 antenna's for about $10 each.

Some were good and some were not so good...

I have a real friend who repairs my computer for free and he is into the CB radio.
I cannot get him to study and get his amateur radio license and I wanted to get him involved in some type of radio - with the hopes that when he see's how much the CB radio sucks - he would want to study and take the test and get his license and quit fooling around with the CB radio...

His best friend drives truck for the DOT and is a garbage man on the side.
They had boxes of old CB radios, and I found a couple that still put out about 3 watts AM with good modulation.

The person my friend bought his computer shop from was an Amateur Radio Operator. He gave the guy a 48' piece of RG-8 coax and 30' of tower.
The tower was bent and no one wanted it - even though it was not rusted or damaged in any other way.

So to help him out, I gave him the Ringo Ranger so he would at least have an outdoors antenna to play with.

I know a Ringo Ranger is a dummy load - no one has to explain it to me.
But at my house with 120' of Belden 9913F7 - up about 28' off the ground, with ground radials, I was able to compare it to my Solorcon A99 - which is tuned for 10 meters.

The Ringo was about 1 or 2 S units less noisy and I was able to talk on 10 meters to a fellow in the Neatherlands with no problems.

So I gave him the antenna, told him to wait until I got there to help put it together and tune it.
When I got there, he already had it on top of the tower and was playing with it.
The VSWR read 5:1 on channel 19

We tried changing the strap match on the ring and it got down to about 3:1 after we changed the match and the length a couple of times.

So after a hearty supper - 4 hours after starting this fiasco, we took it down, put it on a piece of pipe out in the yard.
Took a second Ringo Ranger and combined the two - to make it 11'6 long.

Origionally it was around 9'

I got the match down flat to about 2:1 everywhere from channel 1 to 40!

That is as low as it would go.

I checked the coax and there was no shorts and I used a coax calculator and even with a .66 velocity factor - the brand and type is unknown - and I didn't have a working computer at the site - the length for a piece of coax in multiples of half wavelengths would only be somewhere in the neighborhood of being 2 feet less then what the coax is. Which isn't a big deal, except that he plans on adding another 20' of tower, sometime in the future.

I could give him my old Solorcon A99 and put up my new Solorcon A99 - but I am afraid that if I give away my good antenna, I might have some problems with the Solorcon...

I do not have an antenna analyzer - but I could borrow one..
Yesterday was an exception - because it was a holiday and no one was around to ask if I could borrow theirs.

I know the Ringo needs ground radials and I am working on doing that for him also.
But I am wondering - if there might be another solution to the problem...

I think 11'6 is somewhere around .33 of one wavelength on channel 19....

I usually don't ask these kinds of questions - because usually I have the answer...

If a person had more then 3 watts - loosing half of it between the coax and the antenna mis match wouldn't be a problem...

As it is - he doesn't have a working home phone and I can't call him and he doesn't have internet so I can't email him and there is a hill between his place and my place - about 7 miles away - max and I can't hear him....

His mobile also has a 3:1 mismatch and he put a 104 inch whip on it and is able to talk about half way between his house and my house with his mobile - on the side of a jeep about 3' off the ground...

I have a legal 4 watt CB radio - which normally talks about 12 miles in all directions.

I am looking for idea's on how to make the Ringo better - if that is possible.

Maybe possible lengths to try - only I am afraid that if it gets too long - it will fall apart. The base is already wobbly from taking it up and down the tower 25 times last night.

I don't know if there is a way to tighten the base to the first section of antenna.

I would be willing to try to make it 18' long if that would be an improvement.

Any idea's?

He is also mislabeling the names of the various antennas, and
makes it hard to tell what the heck he really has..
A Ringo Ranger is a VHF or UHF antenna, and is a twin element
collinear vertical. It has a phasing stub type deal between the
two elements. The 2 meter version happens to be about 8.75 ft tall.
A Ringo is a single element halfwave vertical. And Cushcraft does/did
make a 10m version. It's the AR-10, and is appx 16 feet tall.
So I'm starting to wonder if they are using a 2 meter antenna for
10 meters.. ??
It would be fairly easy to convert the RR to a 10m ringo..
Extend to 16 feet, and you would need to use a larger gamma loop,
and a bit longer piece of coax for the capacitor.
I've made them before, and used 1/4 inch copper tubing to make the
gamma loop.
BTW, a 10 meter ringo does not require radials. But it can be
further improved by adding a decoupling section a 1/4 wave down
from the feed point. I used a union to ground the shield to the
metal mast at that point, and had three 1/4 wave radials.

The big selling point when they first came out was no radials needed. I am not sure as it has been a long time ago, but was thinking the origional Ringo was for the CB because of no radials and later moved to other bands.

Then it was found that on the vhf bands the signal went up instead of out to the horizon. That is when the extra piece of coax was added about 1/4 wavelength below the antenna and radials added.

From all I have seen, the Ringo was one of the beter selling antennas and it did not work very well. Same as for the 11 element beams that CC made. Several items like that turned me off from CC years ago.

Tom, here's what John said: "For instance on a full length dipole the ceter feed would be at max amps and lowest volts.etc.I can get this far but how the wire becomes capacative or inductive along its length i cant figure."

I assumed that if he already understand "max amps and lowest volts" and could "get this far", that he already understood the in-phase addition necessary for "max amps" and the out-of-phase (subtraction) necessary for "lowest volts". That's why I said, "You say you understand why the resonant feedpoint is resistive so - so far so good?"

My dictionary does not give "easy" as a definition of "basic". It says "basic" means "fundamental". I don't know how to get any more fundamental than to discuss wave action at the individual component wave level.

An ordinary wire dipole strung vertically will give better SWR's
than you got. It can be tweaked to give 1.5: 1 worst case across the
band. When I find the dimensions I'll post them.

Thanks guys - I found the answer this morning as soon as I looked at the picture of one on the web site...

The seller of the antenna was dead - I couldn't ask him any questions.

His son - was only interested in the money from the sale and couldn't tell me anything because he wasn't a ham like his dad.

The antenna was a 6 meter antenna - hence this antenna would need to be about 224 inches long to work on 10 meters - not 9'

How ever - 138 inches divided by two would be 69 inches which would show some kind of match - but not the one desired.

5'9 x 2 = 11'6 which did show a match with a 2:1 SWR

This means I need to add another 7' to the antenna to get it to work on 27.200 MHz...

All I would need to do is figure out how long to make the stub match and I would be set!

For some reason a 6 meter antenna will receive on 10 meters - ok and will tune up on 10 meters if it is the right length and if a antenna tuner is used.

For some reason the 6 meter Ringo - if not properly adjusted will not transmit on 6 meters - it is a 1 MHz only antenna - not very broad banded...

When I tried it at my house on 50.125 MHz and 52.900 Mhz - it would not tune with my internal tuner in my Kenwood TS 590 - said bad match...

But it would tune just fine on 10 meters - 28.400 - so I figured it was a 10 meter antenna... I didn't get the instructions with the antenna - and I didn't look online to see which model it was.... That was my fault...

Makes a real good dummy load though...

Thanks guys..

About 16.5-17 inches long with coax that has a .66 VF.
It's not too critical.
I'm not sure if the 6m ringo has a large enough gamma loop..
Maybe, if you used most of it.. If it won't match, you could
make a larger loop from copper tubing.
I make the loops from the tubing, then I hammer down the ends
of the tubing so they are flat, and then drill the holes in
the flat part so it can be attached to the mounting hardware.
With a little tweaking of the tap location, you should be able
to get a near perfect match. Don't bother trying to trim the
coax cap.. It's not that critical.. For most 10m half waves,
appx 50 pf is the usual value used. And that cap is actually
optional.. Note that the 6m version did not use a coax cap.
But I've always used one on the 10m ringos I've built.
I think it makes the tuning a little less touchy.

Which is true enough but has nothing to do with the topic under discussion.

You just saw the phrase "standing wave" in the post and in the link
and made the incorrect assumption the link was talking about what was
posted, and it isn't.

Absolutely false! Maximum transmission efficiency occurs when the source impedance is zero, i.e. zero losses in the source. Let's rewrite that above statement to make it valid.

Maximum transfer of available power occurs when the load impedance is conjugately matched to the generator impedance. Such a conjugate match at RF results in a resonant system in which the reactance of the load is neutralized by an opposite sign reactance in the source.

I cannot imagine what your problem is with the 2 meter CushCraft Ringo Ranger. I have had the same one in service off and on since the late 70's. Easy to mount, easy to match, physically durable, priced real close to the cost of the aluminum. The J-Pole is popular now days but is not near the performer that the Ringo is. I have both! The Ringo on a tower is not a good idea because it brings up too many repeaters on a given frequency. Bad operating manners!
As far as the 12 element CushCraft Yagis are concerned I have a 440 & 2 M models and have found them to work just like the modeling programs indicate. There will be a "lump" on the pattern that is not shown in the model, presumably radiation from the Gamma match.

There are ways to improve on CushCraft products (Stainless Hardware!) but in the long haul, you generally get your moneys worth.

I am sorry you have had a bad experience with the Ringo but I don't think you really explained your problems.

A little more information would be a big help. There are a lot of really smart and helpful guys lurking here who have been very generous to me over the years.

Please back up & try again...

Hummm.. Actually, being as the coax is used for capacitance,
the pf per foot would probably be more pertinent than the VF..
Seems like RG-8 is about 26 pf per foot??? I fergot..
And am too lazy to look it up.. :/
But like I say, it's not critical at all.. You could probably
be an inch off either way, and notice little difference in
tuning.

As I understand it, the basic Ringo antenna is a half-wave, end-fed
vertical dipole. A gamma loop at the bottom serves as the impedance
matching element.

The basic J-pole is fundamentally quite similar... it's a half-wave
vertical dipole, end-fed. The common versions of J-pole use one or
another variant of a shorted quarter-wave stub section as an impedance
match.

These two antenna types should, in principle, have very similar
radiation patterns (they're both half-wave radiators) and can have
similar problems with pattern-disturbing "RF on the mast" and "RF on
the feedline" (they're often grounded to the mast, and fed from a
50-ohm feedline without a choke). In some installations, the "RF
where you don't want it" condition could cause the antenna's pattern
to squint in directions where it doesn't do you all that much good,
and have a weaker signal directly out towards the horizon where most
of the repeaters probably are. In other installations (where the
feedline or mast presents a high or highly reactive impedance) you
wouldn't notice any problem.

The Ringo Ranger is a higher-gain antenna, with two vertically-stacked
radiating sections and a phasing stub between them. It looks to me as
if the two sections are 5/8 wavelength or a bit more. You'd get
several dB more gain towards the horizon with this configuration, than
you would get from a J-pole or an original Ringo.

The Ringo Ranger has no decoupling from the mast or feedline, and can
suffer from the same sort of pattern-squint as the Ringo and J-pole.

The Ringo Ranger II adds a decoupling section (a length of feedline
and a set of decoupling radials) which is supposed to prevent this
problem, and it would probably have the cleanest and sharpest
towards-the-horizon pattern of any of these antennas.

A resonant antenna system may still produce a mismatch to the transmission line connected to it. One example is an electrically short whip antenna used on the lower ham bands. It can be resonated using a loading coil, but its radiation resistance may be only a few ohms -- which will produce a significant SWR on the transmission line when the whip is fed with 50 or 75 ohm coax.

> A resonant antenna system may still produce a mismatch to the transmission
> line connected to it.

You are talking about an *impedance* mismatch between the antenna and the Z0 of the transmission line and of course, you are correct. But in an ideal conjugately matched system, such impedance mismatches are irrelevant because maximum available power is transferred, i.e. the *system is resonant* no matter what the impedance mismatch. That's why non-resonant antennas radiate just as well as resonant antennas - they are both components in a *resonant system*.

If we install 1/4WL of lossless Z0=27.4 ohm feedline between a 50 ohm transmitter and a 15 ohm antenna, is there still a mismatch? The SWR on the feedline is 1.8:1 but the transmitter sees a load of 50 ohms looking into the feedline and the 15 ohm antenna sees a source impedance of 15 ohms looking back down the feedline.

In an ideal conjugately matched system, the resistance of any resonant antenna is indeed impedance matched to the *transformed* source resistance. In fact, the above 1/4WL of 27.4 ohm feedline can be replaced with an ideal 50/15 ohm transformer, thus achieving an impedance match, and all conditions in the antenna will remain the same.

The only question remaining is how far can we deviate from an ideal conjugate match and still be satisfied with the results? That requires calculating the losses in the system and losses are the enemy of system-wide conjugate matches. In a system with losses, Walter Maxwell settled for a "one-way conjugate match".

I am trying to receive an am signal well below ground level in a metal server room, there is a coax feed up to the roof which I used and attached the standard wire loop that was supplied with the tuner, however when I attempted to tune into some stations I could only pick up a couple of local stations and wasn't able to receive the ones I was hoping for. when I dialed in the desired frequencies, all I was receiving was a tone, the tone changed in frequency/pitch depending on the tuners frequency. To check that I could receive the stations I took the tuner to the roof and attached the antenna directly and sure enough I could pick up the desired stations. My thoughts are that the coax is affecting the signal in some way, perhaps picking up electrical noise? any advise would be appreciated.

Numbers please...
What make and model tuner?
What loop antenna?
What type of coax cable?
How many feet of coax?

The loop antenna that comes with most home hi-fi receivers is resonant
in the BCB (broadcast band). If you add coax cable or twinlead to the
loop, it becomes detuned and starts looking more like a short circuit.
The barrier strip BCB connections on the back of the hi-fi are
intended for a "long wire" antenna, and a decent ground connection.
The required BCB antenna impedance is probably much higher than your
coax cable, which means you'll need to build a matching network if you
plan to use coax cable to the roof. You might do better with just the
longest wire you can find that makes it up to the roof and beyond, if
it doesn't pickup RFI/EMI from the servers.

If you're plugged into the "F" connector found on the back of some
hi-fi's, that's for FM band reception, not BCB.

>however when I attempted to tune into some stations I could only pick up
>a couple of local stations and wasn't able to receive the ones I was
>hoping for.

That's because the loop antenna is acting more like a short than an
antenna.

>when I dialed in the desired frequencies,

Why would you want to hear BCB AM radio inside a server room?

>all I was
>receiving was a tone, the tone changed in frequency/pitch depending on
>the tuners frequency.

If it's anything like the server farms that I occasionally visit, the
RFI/EMI from the high power switchers, servers, and thousands of clock
oscillators is sufficiently high that I couldn't even get a pair of
cheap FRS/GMRS radios to communicate across the building. I suggest
you consider streaming audio as a better alternative.

>To check that I could receive the stations I took
>the tuner to the roof and attached the antenna directly and sure enough
>I could pick up the desired stations.

Yep. You probably connected the loop directly to the unspecified
model radio. Try it again with an approximate length of unspecified
coax cable and it should fail similarly to your indoor test. Also
note that you're now outside what I suspect is a shielded room, which
should improve reception. For entertainment value, try making a cell
phone call from insider the server room.

>My thoughts are that the coax is
>affecting the signal in some way, perhaps picking up electrical noise?

Yes to both questions.

>any advise would be appreciated.

Long wire antenna or switch to streaming audio.

Or, get an outdoor or marine AM/FM receiver and mount it on the roof
in a weatherproof NEMA box.
<http://www.ticcorp.com/outdoor_amplifiers_amp10pic.htm>
CAT5 should be sufficient to run the audio and DC power down the pipe
to the server cave.

I think a Google on 'active antenna' might give you a lot more general
information. Start here:
http://en.wikipedia.org/wiki/Active_antenna

They typically untuned (and hence fairly wideband).

An active antenna often consists of a short whip antenna, which
functions as a high-impedance RF voltage probe. This is connected to the
input of an amplifier which has a very high input impedance. The
amplifier provides gain, and also converts the high impedance of the
whip to a low impedance, which is suitable for connecting to 50 or 75
ohm coax feeder.

Of course, the amplifier has to be powered, and typically this is
provided by a DC power unit located at the receiver end, which sends the
necessary power back up the coax.

Note that one thing an active antenna must do is not to be overloaded by
strong signals (which can be a problem if you have a local transmitter
or two in your area).

But as I say, have a Google, and see what information it brings you.

Server room? Internet access? Many (most?) of the AM stations in my

stations you want.

I am sure you are too young to remember placing an AM radio on top of a CPU and running certain programs to produce music. Waltzing Matilda was one. I recall my 2 meter FM mobile rig, driving up to the building, hearing the noise from 20 ma. current loop to terminals. You are in the middle of a vast sea of digital noise! All your AC power wiring is conducting it everywhere.

I am not surprised at you hearing tones.

First, you need to have a battery powered radio so the AC wiring is a little further away from the receiver.

Second, you might want to try RG-6 coax. It's cheap and as I recall, double shielded. You will want to find a place to ground one end, only, of the coax to a building ground, not an AC outlet ground wire.

How close is your current coax to other signal carrying cables? Keep the coax as far away as possible. Never running parallel, if possible. And if crossing, cross at right angles.

Finally, does anyone else working there have a radio that is receiving properly?

IF nothing else will work, there is always FM.

Paul, KD7HB

Thank You / Thank You / Thank YOU VERY MUCH!

I can make a loop out of some copper tube and I can use a old piece of RG 8 for the stub match and I have enough aluminum tube from another Ringo to make the mast 18' long.....

All I need to do now is take down what I have and modify it and put it back up.

THANK YOU!

Dummy ME! - I could have bought a used antenna analyzer at a hamfest today for $50.00 - MFJ that had no digital display and no UHF and NO POWER SUPPLY and no instructions.

I was told that I could have used it with a transceiver, turn the knob until it zero beats the frequency of the receiver and then use it to tune the antenna.

I probably messed up!

Then again - if it was $50.00 and didn't work and could not be repaired - it would have been $50.00 that could have been applied towards another antenna.

This is what happens when you try to help someone and when you try to give something away to a friend..
It always happens that something is not right and that when it does not work as intended - even if several years later - I end up being the bad guy.

In fact - the Ringo listens real well - it just doesn't transmit - because the impedance / reactance is wrong.

I could have bought a good antenna analyzer last year for $85.00 and did not because a friend of mine wanted it and bought it for $65.00

I'm learning that amateur radio is a lot like stock car racing.
The only friends you have is the ones you brought to the track with you!
Once the Green flag falls - all agreements are off and it is a free for all.

Hey OM. These antennas are pretty simple, The instructions are on the web. Check the instructions against what you have and you should be able to get them to work by putting them together or making repairs. One is as easy as the other.

Two approaches possible: (1) Disconnect the wire loop from the tuner and attach the coax to the connection points formerly used for the loop.

(2) wrap about fifteen turns of lightweight insulated wire around the loop that came with the tuner. Attach one end of this wire to the coax shield and the other end to the coax center conductor. (It's an RF transformer.)

A man has to know his limitations.. :| chortle... :)

I was up at the dirt patch a couple of weeks ago, and my 80/40 antenna
is pretty much trashed.. And the coax was pretty much gone..
It started raining, so I left before I could do more investigating..
At first I thought someone stole it.. But then I noticed random
pieces of coax laying on the ground.. I think critters, probably
squirrels, must have ate it.. I'll have to look more when I'm
back up there later..
But I know I'm going to have to redo everything, including new
coax if I want to continue to jibber jabber on the radio when I'm
there.
I plan to go back up there around the end of October.
One reason I think it was squirrels, is they had been eating off
areas of coax jacket in the past.. I'd have to wrap chewed up areas
with electrical tape to keep the water out.
I may have to coat my coax with something squirrels don't like. :(

bloggerccc@gmail.com wrote:

> You have no business on either of those frequencies.

Depends upon where you are.

433mhz is a SHARED ham band throughout the world.

In ITU zone 1 and possibly elsewhere, there is a small allocation
of 433mHz for unlicensed devices.

There also is one at 315mHz, but that may be a different part of the world.

It is used for wireless doorbells, security systems, etc. Basicly low power
unlicensed telemetry.

If you look on eBay, you will find hundreds of the devices. A quick web search
shows the 433 mHz units sold in the US.

Geoff.

Thanks for all your responses!

First off, I am attempting to auto switch/scan between two frequencies on AM. I have FM and internet streams sorted. The tuner is a Cambridge Audio hifi tuner with an RS232 interface for scanning. I don't recall the exact model number. The tuner can't be relocated as the server is controlling the frequency scan.

Obviously I didn't attach it to the FM coax input! I do have a small amount of common sense.

The coax cable was already installed, I assume it's standard CT100 75Ohm.

the loop was just one of those cheap plastic things they bundle with tuners.

somebody mentioned impedance matching, Thanks! I'm going to look into this if I can't already find a ready made 50-75Ohm antenna.

somebody else mentioned overloading with an active antenna....this is central London so there are all kinds of local AM stations....what kind of damage can be done??

again thanks for your input, you have given me something to work with. :)

In London, I think the only two main medium wave transmitter sites are
Brookmans Park and Crystal Palace (although I do see a 200 watt 'London
Turkish Radio' in Lea Bridge Road - and there may be one or two others).
http://www.mediumwaveradio.com/uk.php
However, with luck, you are unlikely to find a MW transmitter next door
to your house - and certainly not a really high-powered one.

Adverts for commercial remote active antennas seem few and far between
on Google. However, you might find these of interest. The Wellbrook loop
seems promising. The nulls might be useful, but for all-round coverage,
you'll need to rotate it.

If it's not too much trouble, could you make an effort to determine
the exact model number? I couldn't find a model on their site that
has an RS-232 port for frequency control. Once the model number is
determined, we can then look at the rear panel to see what you're
working with.

While you're at it, it might be useful if you describe the path that
the antenna coax is expected to take on its way to the roof. Is it
metal conduit? Plastic conduit? Random run? Diameter? Numbers?

>The tuner can't be relocated as the server is
>controlling the frequency scan.

I beg to differ. RS-232 will go about 150ft at 9600 baud without
difficulties.

>Obviously I didn't attach it to the FM coax input! I do have a small
>amount of common sense.

Assumption, the mother of all screwups.
That which is most obviously correct, beyond any need of checking, is
usually the problem.

>The coax cable was already installed, I assume it's standard CT100
>75Ohm.

Assumption, the mother of all screwups again. Look at the coax and
get the numbers. Also, what kind of connector.

>the loop was just one of those cheap plastic things they bundle with
>tuners.

Yep, that's what I figured. They're resonant in the AM band and do
not work with extension wires on the leads. If you're ambitious, you
could tear the plastic loop antenna open, replace the fixed tuning
capacitor with a variable, and experiment with different parallel
transmission line lengths. However, I don't think it will work very
well.

>somebody mentioned impedance matching, Thanks! I'm going to look into
>this if I can't already find a ready made 50-75Ohm antenna.

Hopefully, you mean 50 to 75 ohms, not 750 ohms. To get the antenna
in this range, you need a 1/2 wave dipole. At 1MHz, that's 468ft
long. You can shrink the antenna with loading coils, but the usable
bandwidth will decrease to the point of uselessness. An active
antenna might work.

However, I suspect all this design effort is a waste of time. The
receiver should be able to hear stations with a minimal antenna. All
you have to do is figure out where someone else went wrong.

>somebody else mentioned overloading with an active antenna....this is
>central London so there are all kinds of local AM stations....what kind
>of damage can be done??

No damage. The effect is called "blocking" where the front end
transistors or FET's rectify the incoming signal and change the bias
point to where the device no longer amplifies. Unless you have an AM
broadcast station literally next door, it's not going to happen. Your
antenna is too small and the field strengths involved are insufficient
to cause problems.

>again thanks for your input, you have given me something to work with.

Exact model number please.

Hello,

The question I have pertains to feeding an MW AM broadcast antenna tower but also applies in the ham arena as well. Given the advantages of shunt over series feed (no base insulator, tower grounded (lightning protection), no lighting chokes/ring transformers required, etc) why has shunt-feeding of AM broadcast towers been used to-date in relatively few instances in the U.S.? The argument that the slant wire to the tower adversely modifies the antenna pattern doesn't seem to hold up in theory or practice. Thanks for your time and comment and 73s from N4GGO,

Slant wire to the tower?
There is an AM broadcast tower here locally (Netherlands) which uses
a symmetrical version of this feed. The tower is 1/4 wavelength high
and there is a triangle at the top supporting 3 wires running parallel
to the tower and connected to an isolated ring at the bottom, where
it is fed from an antenna tuner in a box at the bottom. The tower
itself existed before the AM transmitter and is grounded at the base.
(there was a VHF omni at the top as well, but it has been removed)

I think it is called a folded unipole antenna. Electrically it looks
like half of a folded dipole.

Without knowing what model you have, I looked at the AZAR 651 series.
http://www.cambridgeaudio.com/assets/documents/AP309771Azur651TUsersManual-01English.pdf

All I see is 300 ohm connection for a loop AM antenna.
So, if you use an antenna on the roof, and 75 ohm coax coming down,
then a 75 to 300 ohm transformer into the receiver. I may even shorten
the leads on the 300 ohm side just to limit ingress.
Does the receiver make all the tones if you short the AM input with a
very short wire?

Hello, and a slant wire at about 45 deg from the ATU to the appropriate connection point on the tower is the classic shunt feed (it is essentially one half of a gamma match that is used with dipole antennas). The folded unipole is the newer kid on the block and it too is a shunt feed. I appreciate the response but this doesn't address my question of why shunt feeding has received so little use in the broadcast industry considering how long the technique has been known.
Sincerely,

I had a plain Two Meter Ringo back in the 70s, before they came out with the "Ranger" versions. It worked well, but gain claimed was probably DBi rather than DBd.

I also have three generations of MFJ antenna analyzers. I don't know if they are overrated, but they are very handy. They save a lot of time compared to using a transmitter and SWR bridge to set up an antenna.

As I understand it, they work just like the typical "reflectometer" SWR bridge where you set forward power to full scale and read reflected power on an SWR scale. Their VFO has its output held constant over the frequency range, calibrated for the equivalent of the SWR bridge's full scale setting.

The early version Channel Jumper mentioned, probably had a frequency scale printed on the face. For critical settings, either a counter or a calibrated receiver would be needed. Later versions have a counter built-in, and the latest also displays antenna data on the LCD display.

I would agree with you - except for the fact that it does make life a
lot easier when you are trying to get a antenna to work and you do not
know what is wrong..

With a digital display it is as simple as putting the antenna together
on the ground, sticking it on a pole someplace, using a feed line that
is as short as possible - less then 1/4 wavelength is desireable when
possible - I know at higher frequencies this is hard to do.

Turning on the Analyzer and reading the input.

Using a old style analyzer isn't as simple when you do not know the
exact frequency you are tuning to...
So in the long run - I probably saved myself $40 - $50.00

A stub match question I forgot to ask is - should the end of the stub
match at 1' 8 inches long be shorted on the end or open...

The web calculator I used said the Stub would be short if it was shorted
and would be long if it was not - but that if it was not shorted you run
the risk of the stub trying to radiate the power applied...

If they rated a ringo using dbd, it would be zero.. Which doesn't
look too good in the ad's.. :|
So they use dbi to make for manlier gain figures..

Dunno, I'm pretty danged fast using just an SWR meter. But I already
know what to expect, how to quickly know if I'm long or short, etc..
All the analyzers do for me is verify what I already know from
looking at the SWR meter, which in my case is built into the radio,
assuming I'm on the Icom. :/
I like not having to carry extra gadgets..

Being Long or Short is not the problem - if it was simple vertical with a ground plane with no loading coil - like a whip on a automobile - yes - you would be right.

But when dealing with a Ringo - which uses a ring to adjust the capacitive / inductive and also uses a tuning stub match - each part of the antenna works against each other..

Even now, the antenna on the VSWR Bridge shows a 2:1 match!

But I figure the Ring is probably 9 inches too shot - if the ring is 7.5 inches in diameter and needs to be 10 and the stub is too short - if it needs to be 18 inches long and is only 6....

The Antenna Analyzer would tell me the Resistive / Reactive components and all I would have to do is match them and it would work on any one frequency.

This is the problem with the Ringo - why it is not broad banded.
The main use where I live was by people who were installers of LMRS equipment that sold them along with a radio to fire companies and ambulances....

I think CC just pulled numbers out of the air. Especially in the eairly days. Just looking at an old ad from 1974. They rate the 2 meter Ringo at 3.75 db gain. No refferance as to what. Also the 11 element was rated at 13.2 db of gain. The only antenna that does make sense is the 4 bay dipole with up to 9 db of gain. Atleast if you put all the dipoles on one side, it could have almost 9 db of gain over a dipole.

I did compair two differant 220 mhz 11 element beams to an 8 element quagi I built from plans in the ARRL Handbook. The quagi was much beter than either of the 11 element CC antennas.
The antennas were put on a 30 foot push up pole so it was easy to change and compair them. Most of the testing was to a repeater about 40 miles away, but the results were the same on other signals.

Common joke was the CC stuff was compaired to the Heathkit Cantenna in terms of db gain.

> 13.2 db of gain.

Which was quite a bit shorter than the CC 214WB. The 214WB, which was better when you took off the marketing based "trigonal" reflector, still only made 11.91 dBd on a 14' 11" boom when optimized (based on your preferences).

BTW the maximum reasonably obtainable gain on a yagi with a boom greater than 1 wavelngth is predictable with the following equation -

G = 10 log (5.4075 B + 4.25) for B GT 1

Where G is gain in dBd and B is boomlength in wavelengths.

I worked this out in the early 90's from a database of over 100 of the best practical, buildable VHF/UHF yagi designs. Thanks especially to K1FO for all of his design work. His 432 yagis had the greatest effect on the numbers. W1JR thinks it's accurate, so who am I to argue?

I designed an extended version of the 214 that lets you re-use the useless extra reflectors as directors. This had a 17' 7" boom and would make 12.43 dBd at 144.2 with a decent feedpoint impedance of 21 ohms and F/B of 24 dB. This was used successfully at a friend's place for a 2 by 2 EME array. The antenna was tested at Central States and met the computer predicted gain exactly.

If you want crazy I have a 432 EME antenna that does 18.4 dBd (according to the model) which tested at 18.1 on the range. They said the range was too short to test the antenna. It was still the highest gain for a homebrew 432 ever tested at Central States.

Anyone that wants any 6m to 70cm designs can drop me an email. I've got lots.

I like the K1FO designs. I had a 432 antenna by Rutland Arays that seemed
to be a copy of the K1FO design. Several years ago I put up some new
antennas and wanted to go withthe Rutland, but he had passed away and went
with the M-Square antennas for 2 meters and 432 mhz.

From what I read, the Trigonal reflector was something that looked good for
sells, but did little or nothing for that antenna.

No problem even with loading coils. Or when using the various
matching systems. They all act fairly predictably.

For a 10m ringo 18 inches would be about right with it tapped
about halfway. I think one I made used about a 20 inch dia turn.
But I didn't need all of it.

>

Sure.. But I can do it by sense of smell.. Plenty of practice.. :/

It should have about the same bandwidth as most any other
half wave. I've never noticed them to really show any less
bandwidth than other designs. But then again, I'm not sure
what you mean by not broad banded. That could vary depending
on expectations.

Linked below is a clip from "Radio Antenna Engineering" by Edmund Laport, which does show some pattern effects from shunt feeding a monopole. The FCC dislikes shunt fed radiators for AM broadcast stations (especially for directional arrays), as their skywave radiation patterns are inconsistent, and interference ratios are more difficult to predict.

Hello, and that identical diagram appears in my 1961 copy of Jasik's "Antenna Engineering Handbook" (McGraw-Hill Book Co.) in the chapter on medium-frequency broadcast antennas. In narrating the diagram (Fig 20-9) Jasik states, "Figure 20-9 shows typical variations in vertical pattern resulting from shunt feed. The radiated field from a shunt-fed tower is essentially the same as that from a series-fed tower of the same height."

The diagram only shows measured data for a slant-wire shunt fed tower rather than a comparison of that with measured data from the same tower being series-fed.

Apparently the FCC disagrees with Jasik. However I think the question from my original post has been addressed ("Because the FCC requires it"). Thanks, Richard. Sincerely and 73s from N4GGO,

And, if you'd like to refer back to Laport's original text in more
detail, it's available as a free BitTorrent or HTTP download, or in an
inexpensive printed form. I scanned a copy and converted it to PDF a
few years ago, after I was able to confirm that it has reverted to the
public domain.

You can get the PDF version from Lulu's servers, at

http://www.lulu.com/shop/edmund-laport/radio-antenna-engineering/ebook/product-17560294.ht
ml

If you want a printed copy, Lulu will do a "print on demand" at their
usual per-page-and-cover cost (I've waived any royalty, and they don't
charge a commission - this helps keep the cost down):

http://www.lulu.com/shop/edmund-laport/radio-antenna-engineering/paperback/product-188778.
html

If you'd prefer to Torrent it, go to my own server to find the control
file:

http://snulbug.mtview.ca.us/books/RadioAntennaEngineering/

Depending on the distance (which might mean an unacceptable
added expense), you could run PVC. I put in a 10 ft satellite dish
in the mid 1980's, running all the cables in PVC because they
needed to be buried for appearance. (The stuff was called "direct
burial, but ... I'm a skeptic.) The point is that it was still fine after
about two decades when I decommissioned it about five years
ago in favor of digital cable. Both ends opened down to keep
moisture from dribbling in but yet letting the inside "breathe" with
temperature changes.

One caution: Just because the cable fits into the coax, you may
not be able to pull the whole length due to internal drag friction.
I had to cut my PVC and thread the cables throught the first
section, then a PVC union and then the second section. Finally,
I glued the cut ends into to the union. If you use big enough
PVC, you won't have my problem.

Channel Jumper-

You can get parts measurements for the various Ringo antennas at the
CushCraft website (Now part of MFJ!). For the Ten Meter version,
<http://www.cushcraftamateur.com/Product.php?productid=AR-10>. A user
manual is available by clicking on "AR-10 Downloads". I do not see a
Stub length given for the AR-10, but the AR-6 manual has a chart.

The AR-10 manual's specification says that gain is 3 dB "Ref.
Quarterwave"!

I used a chunk of circuit board material about 5 mm thick. I don't recall where I got it or why it was so thick but it worked very well for a short period. Can you go to a surplus store and root around in their junk boxes for old circuit boards? If you spray them with electrical varnish after making the connections, you should get some time before failure.

I don't think that would work.. The coax is not running to
a building or anything. I was feeding 80/40 dipoles, with
the feed point between two oak trees, and the coax led over
to one of the trees. I'd just run it out to wherever I was
operating, usually my stone bench. I had about 100 feet of
RG-58..
When I left, I'd just roll the coax up and hang it on a tree
branch. I got about 5 years out of that setup before the
coax went kaput.
One thing I might consider is installing a box or something
to store the bulk of the rolled up coax away from critters.
They still would be able to eat on the part leading to the
antenna, but at least the bulk of it would be fairly safe.
What was weird this time was none of the rolled up coax
was hanging on the tree, and it was broke or unconnected from
the antenna, and only a few little pieces on the ground.
Some varmint might have dragged it off into the woods, but
like I say, it started raining. So I left, and will have to
look for other pieces when I go back up there.
Someone may have stolen the bulk of it..

But I expect it's all basically ruined, so I will be needing
to replace it all. Luckily I use only the thin stuff there,
so cheaper than buying the usual 213 that I use here at the
house. 213 is direct burial.. But it's too heavy for what I'm
doing up there. Too pricy to leave out also, being it's basically
thief bait hanging on the tree branch.
I haven't bought any coax in a few years, and expect sticker
shock due to the price of copper these days.
I've got lots of spare runs of RG-8, but not sure if I have
any rg-58 left or not.. Like I say, the RG-8/213 is too heavy,
even if I wanted to risk leaving it there.
I'd also have to rewire the antennas with thicker wire to support
that heavy stuff and be able to keep tension on the antenna
wires to avoid the droops.

It's in the manual.. Was about 16.5 inches long with the RG-8
they use. They don't give the dia for the single turn coil,
but I've built a few of those, and used 18-20 inches or so dia.
Not real critical being it will be tapped appx mid way for a coil
that diameter. 7.5 inches dia is too small for 10m. Even 10 inches
would likely be too small unless maybe you tapped it near the end,
using almost the whole coil. I don't think I'd make it any less
that 15-16 inches dia.

I overlooked the stub in the manual I downloaded. Now I see it in the
Ring Assembly Parts, Key FF. It is 16 5/8".

Ring diameter is listed as 13" in a chart at the web link above. I do
not see size listed in the manual, where the ring is shown as two
similar pieces bolted together.

Yep, I see it now.. I was thinking it was slightly larger than that,
but maybe the original AR-10 I had was only 13 inches across.
They show the 6m version using the same part.. From the diagram,
it looks like about 2/3 of the turn is used on 10m.
Also, if I remember right, the 6m version used no coax cap for
tuning. I was looking at the 6m ringo PDF the other day.

315 mHz is in a band used by the US military, where they are already "tolerating" a fair amount of intrusion from garage door openers and similar devices. I was privvy to some US Navy classified message traffic that discussed the issue. (It was classified because it identified specific frequencies and such are always classified.)

This fellow, "new to the field," as he self-indentifies, seems like a source for interference more than learning. A bit risky.

I agree. However, you might approach "droop" in other ways.

Depending on the height at which you want to place the feed,
you could potentially add a non-conductive span of nylon line
above, supporting the weight of a heavier coax. (I have several
"quick rigs" for dipoles; one of them includes a span line with
pulleys along the line. One I get the span line up, I can begin to
haul conductors aloft with other line. Reduced element stress.)

The success of this depends on how tall the trees are and how
easy/difficult it is to get into them.

It depends upon where he is. Outside of the US, the US military is a guest,
and has no authority to use those frequencies. Certainly no claim.

There was an international incident here in Israel a few years ago when
a foreign miltary ship with a new radar system parked off the coast of
Lebanon with a new radar system which used the downlink frequency for our
local DBS system.

Within a week, the radar system was shut off, and they ship left.

So just because a military uses a frequency in their home country does not
mean that anyone elsewhere can not use it if it is legal, nor can that
military tell them to stop.

Geoff.

I thought they were internationally allocated worldwide ... that is, certain
bands like 225-400 were reserved for government use, exclusively. (I guess
even so, government could certainly be non-military, too.)

Thanks for the info.

Overcoming my ignorance one day at a time,

> Any idea's?
Ringo antenna - like *all* half wave antennas - don't want the mounting mast
lenght of 1/4 wl and odd multiples. So be careful. Many people said ringo
antenna is bad, no resonance, etc... because of this.

```
Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.2 2011/11/02 04:08:53
Posting-Frequency: posted twice monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

2358. Re: Ringo Ranger Problems

Newsgroup: rec.radio.amateur.antenna
Date: 2012-09-16 01:50:45 UTC
From: Channel Jumper <Channel.Jumper.a9b1558@radiobanter.com>
Message-ID: <Channel.Jumper.a9b1558@radiobanter.com>
Source record: 875

Ok, so what I did was take the antenna apart, add another couple of feet
and made it 16' long.
I shorted out the stub match at 19 inches long.

SWR was about 5:1

So I tried lengthening it to 18' - which did not improve the SWR much.

So I put it back at 16' and I cut the stub match off at the solder point
and I stuck it up 30' in the air and the SWR was 1.1 : 1 at channel 23
and was 1.25 : 1 on channel 1 and was 1 : 1 on channel 19....

Since the person I put it up for only has a 23 channel radio, and since
he only uses channel 19 - that was all he cared about...

Technicially it says it is good for about 1.5 : 1 on any frequency -
hence getting it closer then that was a real accomplishment, and
although I know a little about antenna's - this one had me stumpped.....
Thanks everyone.....

Not that it maters but another ham and myself have been licensed for 40 years.

We ran across somethng the other day that we had not seen before. We live about 10 to 15 air miles apart. I have a vertical dipole at 35 feet on a tower. He has 2 differant FM rigs and vertical dipole wire antenas in his attic about 50 feet apart. I can work him direct on 6 meters with him mobile in his drive way. A couple of days ago we could work with his attic antenna.
He built another antenna , so he has two antennas and rigs. A Midland and GE comercial unit that puts out 40 watts each. I check the sensitivity on a HP 8924C and they both seemed to be as good as a Midland I was using.

It rained and now he can not hear me, but I can hear him fine on either rig and antenna of his. I switched to an Icom 706 at 100 watts out and and checked the reflected power is about 2 watts. At this time, he could tell when I was transmitting ,but not understand me. We were co-ordinating over 2 meters.

I also switched to an OCD antenna at 50 feet and could hear him. The internal tuner on a 746 pro tuned it,but he could not hear me on that either and he was about S-5 on the meter.

Do you think we have discovered one way shingles ???

Anyone else seen anything like this ?

Source record: 879

I am rebuilding my HF station after a lightning strike.

I plan on doing a lot of BPSK31/BPSK63 work.

I want to build a dipole optimized for use on 14070/7080 KHz, and 3581 if possible.

These frequencies are not exact harmonic multiples of each other.

A dipole cut for 3581 operating in 20 meters would be 180 khz off resonance.

Would this be too much of a mismatch if I do not use an antenna tuner?

I want to avoid using an antenna tuner.

Would optimizing the antenna for some nearby or intermediate frequency be a good compromise?

Would an antenna just using 14070/7080 be a better solution?

I am located in EM95vs.
What kind of antenna pattern would get from the following antennas:
350-170 degrees mounted 32 feet above ground at center or 60-240 degrees mounted 45 feet above ground?

More likely you've discovered a nearby lightning strike
and now his RCVR front end is blown.

There are no antenna preamps. All our rigs just go from the output up some coax and to the antennas.
The rigs are just older comercial Midland XTR and GE MLS. They have been reprogrammed to 6 meters.

He has two seperate antennas and rigs. I had just checked all rigs involved in the last two weeks with an HP 8924c test set and all were putting out 30 to 40 watts and the receivers would open the squelch at under .3 uV. I don't recall the exect valuse, but they met the origional specs.
I know the rigs are on frequency to less than 100 hz. Also all were verified that the receive and tramsmitt matched what we have the chanels set for.
The midlands were all programmed off the same programming file and computer.

I do not recall any thunder storms in the area. If it blew the front end, it would have had to do it to two rigs and the antennas are in the attic.

We will check out the sensitivity again at the first chance.

Even multiples don't work for single-wire dipoles. Only odd multiples work. A resonant dipole cut for 3581 would also be resonant around 10.7 MHz, 17.9 MHz, and 25.1 MHz. It would be *anti-resonant* around 7.16 MHz, 14.32 MHz, 21.5 MHz, and 28.7 MHz. Anti-resonance is worst-case for coax fed antennas.

You could build a fan dipole with a separate dipole per band or you could build an 80m dipole with traps for 40m and 20m.

A standard G5RV works well on 80m, 40m, and 20m with a tuner. A ZS6BKW could be optimized for 40m/20m operation by playing with the dipole length and matching section length.

From: ultravista <ultravista.aa05b58@radiobanter.com>
Message-ID: <ultravista.aa05b58@radiobanter.com>
Source record: 888

I recently acquired an Icom IC-706MKII radio. My plan, before I get my license and begin transmitting, is to use the radio for a general coverage and shortwave receiving.

The IC-706 has two coaxial antenna ports and I am looking for antenna suggestions for monitoring shortwave. I live in a house and have the ability to string just about anything up.

Looking for recommendations for a great all-around shortwave antenna that will connect to the coaxial port.

The usual cause when this happens to me is an frequency offset in either
my in rig or the other operators. Are you sure that your rig isn't set
accidently to some type of TX shift. There are two rigs at the other end
and none of them can hear you.

It is doubtful the frequency has been changed in any way. The rigs are comercial FM units and the only way to program them is with a computer connection. Once set, all you can do is change the chanels on it. I know the other ham did not change his as I have the programming cable. All the Midland units were programmed using the same program file at the same time. They worked fine before the rain. The frequencies were even verified with a service monitor after they were programmed. I also used an Icom 746pro and can read the frequency on that, and I did not see the display change frequencies. At 100 watts, he could just hear me in the noise where before the rain we were full quieting with the 40 watt units.

Now that is an idea I have not explored.

A six meter repeater was just put on the air about 5 miles from him and
sometimes there is a power pole that generates enough noise at the repeater
site it desenses the repeater receiver. We are working with the power
people now.
We do not hear it on the repeater, but an AM receiver pickes it up very
well.

I am sure it is not this noise as it is too far away, but he may have a
local source that is causing a problem.

Just about anything will work. Down to a simple random length of wire
stuck in the center conductor of the HF port, and draped around the
living area or yard.

As NM5K said, just about any wire stuck in the HF antenna port will work.
As you plan on getting a license, you may want to look at what is often
called a Carolina Windom. It is a wire about 130 feet long, about 45 feet
from one the wire is cut and a 4 to 1 balun is put in. From this, about 20
feet of coax comes down, then a bead type choke is installed, and from there
enough coax to reach into the shack. The 20 feet of coax should be vertical
if possiable. This antenna will often need a tuner to transmitt with, but
for receiving, it will work very well without one. I use that type with my
Icom 746 and it works very well at 50 feet.
I have also used it at around 30 feet with a 706 and it works ok.

Now the shingles have dried out we can hear each other on all the radios and antennas. I know nothing has changed as the radios need to be programmed by computer and I have the cable.

The distance is just under 10 miles so we should be almost radio line of sight. The land between us is rolling hils. Going from about 600 feet at the lowest to 900 feet at the highest.

Yes. Water is able to damp completly the weak yours waves.
His waves are emitted close to the wet shingles and are damped a little
only.

Thanks! it is the Azur range, I don't go to London often so I can't check the exact model right now....thanks for spotting the 300 Ohm in, the white text on the unit was worn away. when I shorted the input the tone was not present. I'm going to go back in a couple of weeks and get this sorted. Thanks!

I've used this one for several years with good results:

http://www.universal-radio.com/catalog/sw_ant/2205.html

The Par Electronics EF-SWL is an end-fed short wave antenna optimally
designed for 1-30 MHz reception. The radiator is 45 feet of genuine
#18 black polyethylene coated Flex-Weave wire.

This antenna wire is very strong yet can easily be coiled like a rope
for portable work. The UV resistant matchbox houses a wideband 9:1
transformer wound on a binocular core. Unlike other transformers,
external stainless studs on the matchbox allow the user to configure
the primary and secondary grounds for best noise reduction at their
particular location. Examples are given in the manual. Output is via a
silver/teflon SO239 UHF connector (ready to accept a PL-259). Lead-in
coax cable is not provided.

The radiator also attaches via a stainless stud allowing it to be
removed, or replaced with a different length radiator for experimental
purposes. The newly redesigned snag-proof insulators are very strong.
The included manual shows typical radiation patterns for selected
frequencies through out the HF spectrum. (This is a receive-only
antenna).

Order #2205
List Price: $75.00
Your Price: $72.95

Spend your money once and spend it right.

My first antenna was a G5RV which is a poor antenna and is a non
resonant antenna, that does work on 20 meters, but only 20 meters.

My second antenna was a Solorcon / Antron A99 Vertical - which works
well for 10 / 12 / 15 and 17 - with my internal antenna tuner.
I do not like external antenna tuners.

Your technician class license will not allow you to operate anything
lower then 10 meters phone 28.300 - 28.500 MHz USB....

If you are going to spend good money on a resonant HF antenna - that
does not require a expensive antenna tuner - you would want to purchase
a Barker & Williamson BWD 90 - folded dipole.

I'm not sure if you are going to be happy with your combo HF / VHF / UHF
transceiver. It lacks good filtering and doesn't do anything especially
well - other then it affords you the opportunity to use it in more then
one band or mode...

The price of the B&W will probably be one third of what you spent on the
706..

For listening, it doesn't matter how high you put it up, as long as you
put it up and use the best possible coax to feed it.

Two meters / 440 - you would want to purchase a Diamond X 500 and get it
up as high as you can and feed it with the best possible coax such as
the Belden 9913F7 or LMR 400

A long wire from outside that goes directly to the receiver's asymmetrical input will very likely provide sufficient signal for the receiver. It may also receive lots of noise from indoor electronic/electrical equipment. When external noise dominates, further wire length increase will not help (excluding the very looooong ones that operate in traveling wave mode).

If you have the possibility, use coaxial cable for the interior part (75 or 50 Ohms). Donï¿½t worry about mismatch, for reception you just need sufficient signal.

Make sure you connect the braid of the exterior side of the coaxial cable to a ground provision. This can be a ground stake, but every large metallic structure can be used for that. You may add some common mode choke (based on ferrite cores or rods) to further reduce the effect of indoor generated noise.

If you live in a very low noise environment, using a 9:1 transformer will give more signal and noise, given certain wire length. If external noise already dominates, spending lots of money for a 9:1 transformer will not increase your S/N ratio.

Regarding the long wire or loop discussion; whether a loop is useful or not depends on frequency band and local EM environment. You need to try as you can't say beforehand what will work better.

For the cost of the B&W BWD 90 you can get a tuner and use a more simple
dipole. The B&W is really just a big dummy load of an antenna. I have
worked several stations that use them and they were not very strong
compaired to other stations near them. The military uses them because they
can run plenty of power to make up for the short commings of the B&W. Also
they operate over many frequencies and want something simple that will cover
them. It is almost like a radiating dummy load.

The G5RV is ok if high enough. Still nothing special except for maybe 20 meters if the stations are in the correct direction. It does need tuner for transmitting.

For just receiving, just about anything is ok as many have mentioned.

There is nothing wrong with the Icom 706 for casual use. I have one and a 746pro and they compair very well for casual usage except for the filtering the 746 has. I do have a cw filter in the 706 that helps out for cw and rtty. For the price, the 706 is a fine radio.

A very nice antenna is the horizontal loop. If you feed it with a open ladder line you can work the whole HF band. At the station side you need to use a balun, the guanella balun does a great job.

You don't even have to make the loop resonant, I have a loop with 135 meters circumference, the feeder is an open ladder line ending in a guanella balun. I can use all bands from 160m to 10m on that antenna, using my rigs internal match.

No matter what antenna you finally choose, you have to get it up as high as you can, if you want to get connections from far away anyway.

I think it is more then obvious that you do not know what you are
talking about when it comes to antenna's.

The key to any antenna is LOCATION / LOCATION / LOCATION....

If you are in a crappy location, it is not going to work well...

If you are in a good location, the B & W 90 will out talk your Carolina
Windom or any other long wire antenna, due to the fact that antenna
tuners reduce the amount of power applied and they do not physically
tune the antenna, just the coax to the antenna. The only tuners that
works is the ones that are placed directly at the feed point of the
antenna, not something inside of the shack...

The B&W 90 on 20 meters acts kind of like a beam antenna, which exhibits
some forward gain - due to the nature of it's construction.
The one wire acts like a reflector while the other wire acts like a
driven element.

On 40 meters it still acts like a 1.5 wave antenna and on 80 meters it
acts like a Dipole antenna...

On 160 meters - if you wanted to be all that you could be - it would need to be 80' or more } depending upon terrain } off the ground to get in the right place for it to be at optimum height...
It also depends upon the ground {earth } underneath the antenna...
Wet / swampy earth is always better then rocky dry soil....

You have to realize what arrival angle the DX signals come in at and the fact that there is two signals you are receiving, both the direct path { good} and the reflection off the earth { bad} at Gb before reaching our station location..

Unless you compared the two antenna's at the same location at the same time, at the same height within one hour of each other, there is no way for sure for you to comment about which antenna works best...

10 - 40 meters band equals about 19.9 meters of height mininum / needed to get optimal angle.

20 meters likes about 32 meters of height, heights between 15 and 32 meters - { 50 - 105 feet are about as good as you can get} for anything between 6 meters and 160 meters....

Most people just puts their wire antenna in a tree about 40' high or strings it up between two towers and calls it good enough.
The problem is - there is a null on the ends of the antenna and the path that the signal uses isn't always a straight line...

The problem is - with a 160 meter antenna, this is hard to accomplish, hence it is easier to use a vertical antenna for 80 and 160 meters - but is very expensive to use a base tuner and a 80 / 160 meter vertical antenna - which must be supported by some type of tower in most locations.

The wind would damage it quickly and its survival rate would be poor without some type of support...

At the same time, my antenna is mounted 20' off the ground between two houses, and a jib boom mounted on the back of my house, fed with 40' of cheap Radio Shack coax and it still talks well in most directions.

I can hear north / south / east / west with a antenna that is aimed east and west and sometimes when the Maritime Mobile net or the YL network needs a relay station, I can relay between two signals - where they are using some type of beam antenna for the monitoring station and the person trying to check in either has a beam with a poor signal or a G5RV...
And I never run more then 100 watts!

Even when they are running 1000 watts - my signal still is better then most peoples signals on 20 and 40 meters....
If I really need some help, I just turn on the processor and it has enough compression that I can get through, even when there is a pile up...

From someone that did not know about the ringo type antenna and what it took to make it a halfwave, you make the statement that I don't know what I am talking about when it comes to antennas.

Now you are saying that because the B&W has two wires it acts like a beam. This is not correct at all.

A tuner will allow antennas to match the nominal 50 ohm output of a transmitter to the antenna system that is not 50 ohms. You will loose about 5 to 10 percent of the power in a tuner. That crappy B&W burns up most of its power in that big resistor in the middle of it.

The simple wire antennas while having gain in one direction will not have gain in another direction. Unless you have specific stations to talk with, the gain may be useless if it is in the wrong direction.

Talking about pot=kettle=black... :/

>
> The key to any antenna is LOCATION / LOCATION / LOCATION....

I don't think the guy is going to move so he can have the
optimum location to string up a wire..

>
> If you are in a crappy location, it is not going to work well...

That would generally apply to any antenna installed in that
location. But for what he wants to do, which is merely listen
to the HF bands, almost anything is going to do reasonably well.
One poster had a point about possible shack noise, but not all
homes are huge noise sources. I remember as a SWL, I often ran
simple random wires, merely stuck in the center conductor, and
had perfectly acceptable results. If shack noise rears it's ugly
head, then it's time to consider other options.
But it's quite possible that shack noise will not be a huge issue.
You never know until you try it.
>

That's silly.. Do you think that matching at the feed point
ensures no loss? Better think again..
It would be quite possible for a shack tuned system to show
less loss than the B&W, if designed right, and one used the
very least inductance needed to get an acceptable match.

It most certainly does not.. It acts like an appx 3 wave long folded
dipole..

>
> On 40 meters it still acts like a 1.5 wave antenna and on 80 meters it
> acts like a Dipole antenna...

Well, almost.. It's a bit short on 80, and with the resister at the
feed point to match it, it would never be as good as the full size coax
fed dipoles I run. Ever.
Mine require no matching whatsoever. Zero, nada, zip..

Even 80 feet is fairly low for a 160m dipole, but this is not a strong
issue being as he only wants to receive.

>

How are you going to receive a space or ground wave from a DX station?

>
> Unless you compared the two antenna's at the same location at the same

Can't really argue with that.. But it is fairly easy to predict..

>
> 10 - 40 meters band equals about 19.9 meters of height mininum / needed
> to get optimal angle.

But what is the optimum angle? It's going to vary, depending on the
path. And each band would need a different height to be optimum at a
certain angle. It's not worth worrying about in his case, unless he
wants to chase his tail.

>
> 20 meters likes about 32 meters of height, heights between 15 and 32

> between 6 meters and 160 meters....

Sure.. Almost anything is going to work at 96 feet in the air..
But it's overkill for what he wants to do, which is merely receive.

This is going to be the case no matter how high it is. I bet the
nulls would actually be more pronounced the higher you installed it.
Not that it's something worth worrying about for general receive use..
He's still going to receive signals in the null directions. They just
might be down a tad vs the favored directions.
The pattern off a dipole that long would likely be like an "X".

Huh?? Why would base feeding a 160m vertical be expensive?
It's never cost me much money.. :/

A random length of wire strung around your yard, and coming to the
central connector of your coax plug, will probably give you more
stations than you know what to do with.

If you want to get fancier, MFJ makes an inexpensive random wire tuner
(#16010) that you can peak for maximum signal strength. This is
something you could also use when you get your license and are ready
to transmit.

You could also build a random length dipole, and feed it with coax,
connecting the center conductor to one leg, and the braid to the other
leg.

Lots of options here. Start simple.

I want to build a home made omni for use on tower.

I want to feed it with coax and have lot of wire, copper pipe, tubing, basic parts.

I have a pretty good tuner and will use the tuner to tune. Can anyone make a recommendation as to how to make a not so complicated omni directional antenna that practical?

I am thinking something about 6 to 10 foot in height only, I can make gnd planes, but something I can tune to get most bands and simply omni function. I want to get all bands and I run barefoot and just want to get on the air with simplest, least complicated, easiest to build omni. I don't need a electronics lesson in engineering design, just a website or two explaining the simple build of the magical omni fed with coax that is the best I can get for my situation.

Thanks

You have set yourself up for quite a challenge! Limiting yourself to a length of "6 to 10 feet" is going to be a problem. At ten feet you'll be more-or-less resonant on 10 and 12 meters, and will be able to use the tuner for 15m and (maybe) 20.

Even much longer antennas don't work all bands, although some use coils to improve coverage.

In short, a shorty antenna will not work well on all bands. If you have room, you'd be better off with separate verticals for each of the bands you want to use.

How about a car/truck "screwdriver" antenna?

>>> I have a pretty good tuner and will use the tuner to tune.

The combination of a short vertical, a tuner in the shack, and a coax
feed, is not a particularly happy one.

You *may* be able to tune it, in the sense of presenting a load to
your transceiver which won't cause its output section to complain or
leak blue smoke. However, the losses in the tuner, and (particularly)
in the coax feedline, are likely to be very high... you won't get
much signal out, and you may end up with high enough voltages on some
sections of your coaxial feedline to cause arcing (even at "barefoot"
power levels!)

So, the two approaches I can think of which might work would be:

(1) A "screwdriver" antenna or equivalent... a vertical whip (longer
is better) and a remotely-adjustable loading coil.

(2) A vertical whip, and a remote-controlled (or self-controlled)
antenna tuner / transmatch mounted right at the base of the whip.

In either case, you'll probably need to use the tower itself as the
"ground" (counterpoise) for the tuned antenna... plan on running some
heavy, low-impedance braid from the tuner to the antenna mount point.

wanted to throw up a crazy idea, I know it is a very broad question. What
is
the smallest thing I could use with a pretty good tuner? On top the
utility
tower?

With an antenna that short, you will need a ground for it to work against. If you can manage that with guy wires etc., let me relate my recent experience.

I use a vertical mounted above a metal patio cover, which is about 15x30 feet, roughly 10 feet off the ground. The feedline is 15 feet of RG8 to a tuner.

Initially, I installed a 9 foot CB whip antenna. It worked quite well on 12 and 10 meters. 17 and 15 meters were hard to match, and marginal contacts were made on 20 meters.

I replaced that whip with a 14 foot whip. It worked quite well on 20 meters through 10 meters. I was quite happy with it, but got the bug to experiment some more.

lastly, I replaced the whip with a 17 foot whip. It works well on 30 meters through 15 meters, and can be brute force loaded on 40 meters through 10 meters. I don't have much performance info, since the bands have been stinko for a while.

Both the 9 foot whip and the 14 foot whip did a credible job during the last set of DX contests, with the 14 foot clearly being better.

In summary, if the antenna is 8-10 feet, I wouldn't count on getting much performance other than on the higher bands, say 15-10.

Have you chosen a frequency you might want to use? That's kind of
important.

:) I was wondering the same thing. There's a lot of difference between antennas for 4 MHz and 440 MHz.

Hi
Thanks for all the info and advice and ideas.

I have the 102 foot dipole up there now, my problem is I just put a TV antenna HD (two 8 bay bow tie Channelmaster) antennas right above the dipole's center point (about 1 meter away) and now I am having difficulty tuning that dipole for anyband. In fact if I try too long the old 1970 transceiver shuts off automatically and scares me that I may have some of that blue smoke you talked about. So I wanted to get something above it, omni that would work as well as the dipole did work. Something simple, and easy becuase nothing up there on the top now.

I think as you folks mentioned the omni fed with coax at short lengths will be difficult unless it is long enough and with gnd planes, but first wind storm will bring it down.

I will focus back onto the dipole. Do you think it is too close to the new TV antennas? Would that cause the innability to tune it where I was able to before through the manual tuner?

What would be a suitable distance from the center point of that dipole to be away from anything that would cause such innability to tune. Right now I am thinking one of the legs of the dipole are fractured and that is the problem. I don't have a way to test each leg of the dipole, it is about 50 feet of ladder line and then each leg but how do you test from the shack if there is a fracture without the fancy scopes that you guys have? Other than bringing each leg down and using ohm meter from one end to the other.

Any comments about having those channel master HD antennas too close to the center feed point of a dipole? And the havok it can do to an old transceiver and tuner?

Thanks

73s

I doubt the TV antenna is affecting the dipole. You may have broken the dipole or feed line when you put up the TV antenna.

Also check to see that you did not put the TV feedline too close to the dipole feedline. It should be atleast a foot or more from it..

I think you are right in your statement of breaking the dipole or feedline upon installing the tv antenna.

The tv antenna feedline is no where near the ladder line, about 4 feet distance.

I suppose my next move is to pull down the dipole, check, and either fix or eliminate that as my problem. I was hoping I didn't have to do that. But if that copper solid wire, both in ladder line and dipole had fractured, I would think it would be visible from gnd (about 35 feet height). All worked before the tv antenna installation, and yes there was a lot of banging and jamming and bumping of that dipole while installing the TV antenna but nothing is visuably broken, maybe a hairline fracture. Looks like a climb is in order. That is not one of my most favorite things, climbing 50 feet above the ground on a self supporting tower. I hate climbing but do it every time. I will let you know how I make out, probably climb today or tomorrow, looks like rain.

Thanks and 73s

While you are up there you may want to extend a pieceof pipe off the tower
and put a pulely on it. Then put a loop of small rope that goes to the
pulley and back to the ground. That way you will not have to climb the
tower as often.

2405. Re: Home made antenna question??

Source record: 772

That is great idea. I have a piece of plastic pipe extending out about 6 ft from the tower, about 45ft from the gnd, it is 2" ABS plastic pipe with a hole in the end so just need to run the cord through there without the pulley idea. I ran the ladder line straight up, the pipe holds the entire weight of the dipole, ladder line which I spun a few times for wind resistence. I have always had luck with that dipole, and really wondering why it failed. It shouldn't have as it is only about 2 years old. I must have damaged it when doing other things. That is my goal today to bring that down and find the damage and repair it.

Now here is my querry ,,, I have a omni antenna I purchased at ham fest years ago. I had it up on the tower for SWL for longest time and worked well and also worked well when in transmit.

i used the big tunner to keep what I thought was safe levels of returned power. I want to put this back up and use with big tuner and 1970 transceiver.

http://www.intelgold.com/vk4uq/manuals/Hidaka%20VS41-VS80KR%20-%203.pdf

http://www.intelgold.com/vk4uq/manuals/Hidaka%20VS41-VS80KR%20-%202.pdf

Now I can fabricate some aluminum gnd planes to go with this, this should be on the ground but I want it in the air. While the traps and entire antenna looks good shape, how can I tell if those traps are in working shape before spending all the time cleaning it up, erecting it, etc etc, only to find it is dead? The traps are completely sealed in there, the antenna looks about as old as the transceiver, if not older. I am on a shoe string budget of course so I cannot buy one of those fancy all band omni antennas, I have to build.

Please comment on this antenna and my ideas about getting it working 50 feet above the gnd.

Thanks

73s

To check the vertical without any special equipment, you may have to install
it at ground level and see how the SWR is.

I do not think I would try to put it on the tower. If you look at the
instructions, you will need atleast 3 or more radials for each band and some
of them will be about 60 to 130 feet long.

I was thinking of 4 radials about 8ft length.

Now I think because of height and present elevation and the big tuner it
will function safely, what would be the reasons why not to use this? I am
sure there are loses at the tuner, loses at the coax, loses becuase of poor
gnd planes lengths and numbers, but there has to be some gains. It works
would be a big gain.

Would there be mass interferrence on anything?

I (and probably many others) have a wireless router in the house which in my case runs at 2.4Ghz via a single antenna about 10 cm high. Certainly omnidirectional which is my issue. As its against a wall near the road 1/2 the signal
keeps neighbours and passing traffic with a WiFi point. Or at least is just wasting 1/2 the radiated power.
My questions are : Is putting a reflector adjacent to the antenna on the road side sufficient to screen off the signal? A follow on from that is would that reflected signal boost signal levels in the house?.
If the info provided is not detailed enough, sorry about that. Question is born of ignorance which is rectifiable!
Many thanks
John

Hi John.

If you're using the router's security (password, unique ID etc) then it
shouldn't be open to neighbours and passing traffic.
A reflector will not reduce that power wastage you mentioned.
Is the router in the best place for your use in your house?

Best wishes, Ian.

I have a different opinion than Ian.
Installing a reflector will weaken the signal going towards the road and
enhance the signal in the other direction.

Here's an easy one to build.

http://www.freeantennas.com/projects/Ez-10/

and another

http://www.freeantennas.com/projects/template2/index.html

If you put some aluminum kitchen foil at around 0.25 lambda (1.2", 30
mm behind antenna, about 1 square foot in size) behind the antenna,
you will reduce the radiation to that direction and icrease the
radiation perpendicular to the aluminum kitchen foil. The radiation
pattern will be close to that of a single resonator patch antenna.

You will not screen it completely as due to multiple reflection it
may/will reach the road again, but it may improve indoor coverage.

There's always some location where your wireless router is going to be
heard. You can reduce the signal by placing something either RF
absorbent or RF reflective between the antenna and the road, but
you'll never get rid of all of the signal. Someone with a high gain
(dish) antenna, can probably pickup enough signal if they are
sufficiently determined.

Your best protection is the encryption built into your wireless
router. WPA2-PSK-AES is the best.

As for improving the signal in other parts of the house, that depends
on the shape and composition of the house. 2.4Ghz does not penetrate
walls very well. If the walls are hollow and mostly wood, they're
almost transparent to RF. However, if the walls are stuffed with
aluminum foil backed fiberglass insulation, very little will pass.

Optimizing the antenna pattern to best cover the house is possible,
but there are limitations. Antennas do not create RF. The merely
redirect it. If you want to increase the amount of RF in one area,
you have to do it at the expense of other areas. For example, since
your omnidirectional antenna wastes some RF aimed toward the road, a
simple reflector will bounce much of this RF back into the house. That
may help or hinder depending on whether the incident and reflected
signals add or cancel. For a start, a large sheet of aluminum foil
taped to the wall might be useful.

I use an Android phone app called Wifi Analyzer. Among other features
it has a pseudo analog type meter showing your WiFi signal strength
that updates every few seconds so it will give you an idea of your
antenna pattern as you walk around your house.

Also the app can tell you what WiFi channels your neighbors are using.
If possible set your channel as far away as possible from the
strongest signal (likely your next door neighbor) and it may increase
your speed.

Gents(?)
Many thanks for replies. As you say Security may be provided other
ways . In some ways my wife and I are Luddites and our phone can do phone
calls and thats it so Aarons suggestion is out. My laptop though has a six
segment "bargraph" for router signal strength. I,ll follow yours suggestions
and see what happens. I,ll nick some of good wifes Alfoil.

I think that someone here is over stressing the thought process of how their wireless system works.

NO your antenna is not OMNI Directional - that is called a ISOTROPIC, and a isotropic antenna is a mythical antenna - rumor is a paper clip on 160 meters - 1.8 MHz is a true Isotropic antenna.

A vertical antenna has lobes the same as all other antenna's.

There isn't any way to reflect your signal - all in one direction to improve service in one direction and block service in others - other then the modification and use of a sat dish, and even then, that is just for point to point communications - Line Of Sight.

A NANO station on the roof would allow your signal to be received up to 18 miles away - Line Of Sight..
Anything made by man can be listened to by man...

A wireless Modem is very primative technology - but beyond the reach of most people walking the street.

The purpose of the name and password is not to keep people out of your system - spying on you - you ninny.
But to keep unauthorized people from using your system...

You see - the cable company or service provider gets PAID for each of their customers.
When you open up your link - someone gets to use your WIFI for FREE!

The cable company or service provider is LOOSING MONEY.
They don't want you to give away their service for FREE...

No one without some type of college / technicial school degree, and a lot of expensive equipment, can hack into your personal computer no matter if they have access to your internet or not.

All you are doing is wasting your time and ours with this question - it is silly to worry about something like this, unless you are doing something illegal and are trying not to get caught.

I built a house for a man 30 years ago, in which we covered the entire house with a heavy gauge aluminum foil , roof / walls, floors, windows / doors and grounded all the aluminum to earth ground.

I discovered that the nails used to penetrate the aluminum foil, to hold the shingles on the roof and the siding on the walls radiated the RF signals better then if he would have just left it bare - no shielding at all.

NOW - if he would have used a copper based foil, and used copper nails - he probably would have accomplished what he was trying to do.

The walls on this house were 12 inches thick and insulated with spray foam - new technology at that time, and he used a air exchanger because the house was so tight, it would actually accumulate moisture inside of the house from your breath. You could heat the house with a 100 watt light bulb or a candle in each room.

Needless to say - he lived there for 30 years, applied for his social security at the age of 62 and promptly died before he received his first check...
All of the money he saved in heating bills, paid for the insulation and the aluminum foil. The roof did have to be replaced one time in 30 years.

The house now sits idle, because no one knows what to do with it.
I doubt if you could hear his WIFI signal from outside the house, but why bother?

Get rid of your antenna, run wire to each room and connect directly to the internet and don't worry about it.

Just keep one thing in mind.
When Joe Paterno was arrested for a crime he did not commit, his email records were retreived for the past 12 years.
So everything you do, everything you say is all being digitally recorded and stored someplace. So your very best bet is not to say anything you do not want others to know about. Not to visit any site - you do not want to be held accountable for, and not to text anything over your cell phone.

ps - even the digital cell phones can be listened to - if you have the right equipment. If the cell phone companies has the technology - definately the people who makes that technology also has receivers.

The State Police, FBI , CIA and a whole list of agencies doesn't even have to use a antenna to receive it. They can access the towers via the internet and listen to your cell phone calls in real time and can even record them for future reference.

So nothing electronic is secure!

Me personally - if I want to use your wireless internet connection, I will hack into it, and you won't even know that I am doing it.
Its much easier to have the equipment to take it directly off the coax of the Comcast then it is to receive it via OTA, and the signal is more reliable and quieter and faster.

Basically your signal is receiveable for a distance of about 150'
How long can a car traveling past your house use your WIFI connection if it is traveling 35 MPH?
How far away are your neighbors?

Get all of them to give you $5.00 a month and give them the password.
10 or 12 people - and it would pay your internet bill for the month..
Quit being so stingy...

I live in a quiet rural area of North Carolina. I leave my wireless
connection open in case my neighbors or folks passing through can use
it if they have a need. It is also open at my church and my fire
station. No vandalism so far. Several parents who used to drop their
kids off for programs now find a quiet classroom and hang around. A
couple have owned up to stopping by in the daytime for a quiet place
to get some work done. It is a plus that cell phones don't work there.
As far as the Fire Station goes, we are 100% volunteers and anything I
can do to encourage the firefighters to hang around is simply good
business.
Of course, your world my be a lot different than mine...

Not overstressing thought process at all CJ and was aware of all, repeat
all, your comments. Previously in
first post I was quite open in stating my 50 years experience in electronics
was at opposite end of spectrum. Principally in medical electronics design
where typically heart signals dont hold much info above 1kHz.
End results of this particular issue though is great success. I think I
used all suggestions put forward to some extent!!. Resited Router from
behind Monitor to avoid shadowing from metal chassis. "She who must be
obeyed" didnt think much of a reflector as described as decoration BUT I
noticed the router was in front of a picture about the same
dimensions/distance as suggested for a reflector. Covered the picture back
in foil.
Bargraph is now sitting on all segments!!!. Many thanks again everyone,
education is a great thing..
I lectured in Digital/analogue for many years and found ignorance is
not the same as stupidity but the reciprocal almost always hold true.

John

2419. Dipole advice

Newsgroup: rec.radio.amateur.antenna
Date: 2012-09-29 23:22:29 UTC
From: Tom <abraa@cadabraa.ca>
Message-ID: <WoL9s.4054$sB3.3916@newsfe05.iad>
Source record: 786

Building a G5RV which will be 102 ft and fed with 450 ohm ladder line and will be about 40 ft above the gnd.

Because the hole in the wall next to my shack has several coaxes, a gnd wire (coated) going through the same pipe (1-1/4") pvc. from shack to outside to tower then up. About 7 feet from back of tuner through wall then upward sweep towards center of dipole (about 35 feet).

Should I use a 50 ohm coax through that hole, to the tuner (no balun) then to the ladder line? Or should I simply run the ladder line through that hole, beside the other wires (touching) but both have insulated jacket or pvc jacket. But very close through that pipe. The ladder line connects to the same tuner (balun).

I am worried about running the ladder line feed through that hole beside all the two other coaxes, and a gnd wire. They have to go through the same hole pipe. Which is better, only running lower power (less than 100 watts)?

Thanks

73s

What some hams do is switch from ladder-line to short parallel runs of coax through the wall. Tie the ladder-line conductors to the center conductors on the two pieces of coax and ground the outside braids. The balun can be located on the inside wall.

While the ladderline is insulated, the RF extends for a distance from the
ladder line. It should be several inches or more from anything that is
conductive.

That said, use coax from the shack to the ladder line of the g5rv.
The ladder line does not usaully go to a 4:1 balun, but a choke 1:1 type of
balun then to a 50 ohm coax.

I have a balun in the tuner for the ladder line but not for the 50 ohm coax. Should the 1:1 balun be right at the bottom of the ladder line? Or can it go without a balun?

You can feed the ladder line with 50 ohm coax. That is the way the g5rv is
designed. It is sometimes helpful if you put one of the choke type baluns
at this point. That is the kind of balun that is a piece of coax with the
ferrite beads over the outer portion of the coax.
This will help keep the RF out of the shack if it becomes a problem.

The g5rv does not need a 4:1 type of balun at the feed point of the ladder
line as it is designed to be near 50 ohms at that point. That is the reason
the ladder line needs to be the designed length. Then you just use 50 ohm
coax to go to the tuner. Shorter or longer and there will be problems.

2424. Re: Dipole advice

Newsgroup: rec.radio.amateur.antenna

The length of the 50ohm coax from the tuner to the ladderline sweep will be
9 foot. Is there a more specific lenght I should make that coax?

YOu can make the 50 ohm coax any length you need.
The critica length is the ladder line. It must be the design length for the
g5rv. This line is what converts the impedance of the antenna to near 50
ohms.

This answer is correct, however - it seems that you do not know what you
are doing, especially since you chose to build a G5RV antenna.
A G5RV antenna is only resonant on 20 meter ONLY - PERIOD!

Using a tuner with a G5RV does not improve its performance anywhere
else.

I have two MFJ 949's - Both Broke, both were broke when I bought them.
I believe both were ruined when they were connected to a G5RV and were
operated on 10 or 40 meters.

The ladder line is the matching network.
This is what made it resonant on 20 meters ONLY

After the ladder line - you add the Balun so you can bring it into the
shack.

The purpose of the ladder line is so you hang it 40' or more above
ground.

And - the ladder line needs to be at a 90* angle from the dipole for it to work.

So there is no extra ladder line left over after you put it up.

You want the feed point of the antenna 50' away from the shack.

The RF it emits is so bad - your computer and mouse will probably crash if you used it with any type of amplification and was too close to the computer..

The only purpose of building the G5RV is maybe to experiment with non resonant antenna's or to try and save a couple of dollars - if you already had the materials to make one.. Since the cost of a professionally built G5RV at most hamfests is about $65.00

The man who designed and built the G5RV - Varney - went nuts from trying to make this antenna work.
If he was alive today, he would tell you that he was sorry that he ever designed it and that it did not work very well anywhere...

Your money would be better spent building a double bazooka which would be resonant with a antenna tuner on more then just one band!

If you would like to purchase a G5RV - I have a brand new one here - still in the bag, used for two weeks and rolled back up again..
AND - I am not made of money, so if it worked, you can bet it would still be up yet!

$65.00 delivered to your front door!

That looks like next antenna, I am already committed with the materials I have. I have lots of solid copper wire 16ga and 450 ohm ladder line. And I don't have enough coax, only about 10ft left. So was gonna plug it together without running to town. I seldom return early when heading into town.

Yes, the original G5RV was originally intended to be a 20M only
antenna. However it was soon found that a 102 foot version used with a
tuner, some times without ladder line, at elevations near the ground
to way up there could be use full on other bands. All sorts of
matching schemes have been used and a tuner at the radio end helps
clean things up. A motivated Ham can get reasonable results most of
the time.

10 Meters is a little tricky for the 102 foot length.

If you have a tuner that was damaged trying to tune a G5RV the only
possible explanation is that of a misinformed or careless operator.

"you do not know what you are doing" Is disparaging troll talk.

The G5RV can usually be a pretty good all-purpose HF antenna - subject
to certain limitations - and even some of these have been got around
with various modifications etc. It's worth doing a Google on
'G5RV+original'. In particular, this paper by L B Cebick contains a lot
of good information.

It doesn't matter if an antenna is resonant or non-resonant. What matters is achieving a conjugate match somewhere in a low-loss antenna system. The G5RV achieves a relatively low-loss conjugate match on 80m, 40m, 20m, and 12m using a tuner. Here's a quote from G5RV himself in 1984 from the ARRL Antenna Compendium, Vol 1:

"The G5RV antenna, with its special feeder arrangement, is a multiband center-fed antenna capable of efficient operation on all HF bands ..." I personally don't agree that the G5RV is capable of efficient operation on 30m, 17m, 15m, and 10m.

When the G5RV was first conceived (1946), we didn't have 30m and 17m
(introduced early 80s) - nor did we have 15m (1947). Maybe he was just
being a bit optimistic?

In Mr. Varney's 1980's article, he recommended a choke, about 8-10
turns of coax in a coil about 6" in diameter, taped together, with the
coil right below where the coax connects to the ladderline. (The coil
and the coax feed are both of one piece.) The coil can keep rf from
flowing on the outside of your coax.

I'd prefer to run the ladder line the whole way from the tuner
to the antenna. I see no benefit to using the twin coax section,
as it will act the same, except with larger conductors.
And I've never been a fan of coax/choke/ladder line feed line
schemes. I've never seen any real problems from having ladder line
near other metal or wires as long as they are not parallel for
any long distance. Short distances such as a ladder line crossing
a metal window frame that's close on it, seem to have very little
overall effect.
From a feed line and system loss point of view, using all ladder
line, and the minimum tuner inductance needed to get a match would
be the best way to go.
And like Cecil said, whether an antenna is resonant or not means
very little as long as you can get the power to it without it
turning to heat.
Even a short 1/10 WL dipole would radiate nearly all power applied
to it. If you can get it there intact... :/ That's the trick.

I use resonant dipoles, but it's not because of any special
property with the antenna itself. It just happens than it
makes it very efficient and convenient to feed directly with
coax. I need no matching, so I have no matching loss.
The only real system loss I see is the loss per foot through
the coax feed line, which will increase with frequency.
On the lower HF bands, coax is quite low loss per foot, so
my overall losses will be quite low, even with RG-58 at
reasonable lengths.

Ladder line is handy as it's losses are still usually fairly
low even with a high SWR. So usually most of what comes out
of the tuner, makes it to the antenna.
This will often not be the case with the coax/choke/ladder line
schemes. :(

Chokes made from coax are limited in frequency range. There was a link
to an application that gave the specs for a coax choke provided by one
of the people here once upon a time. I'll see if I can dig it up.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

A good example of an efficient non-resonant antenna is an EDZ, extended double Zepp. I modeled a 20m EDZ with EZNEC. It has a feedpoint impedance of 175-j1000 ohms, clearly non-resonant. Using 10.3 feet of open-wire line as a matching section, the SWR on the coax to the shack is 1.1:1. The EDZ has 3 dB gain over a resonant 1/2WL dipole in the direction of the dipole's maximum gain.

Why is this non-resonant antenna so efficient? First, because it is a low-loss antenna system. Second, because it has a near conjugate match at the feedpoint. If one terminates the matching section in 46 ohms and measures the impedance looking back from the antenna feedpoint one will measure very close to 175+j1000 ohms.

Non-resonant antenna feedpoint of 175-j1000 ohms with an impedance looking back down the transmission line of 175+j1000 ohms. That's the formula for maximum transfer of available power from the source to the load. The non-resonant antenna length doesn't matter because the entire system is resonant.

The EDZ is non-resonant without a feedline. Strangely enough, a 1/2WL dipole with an insulator in the middle is also *non-resonant without a feedline.

I posted this previously on another forum, but for the sake of arguement I will post it again...

I will use a very easy example, KDKA Pittsburgh AM 1020
They built a tower 718 feet (218 meters) tall and fed it with tens of thousands of watts of power..
This allows anyone with a simple receiver to receive their signal with a antenna 32 - 36 inches long, even in Daytona Fla when they were still running the old Westinghouse transmitter 50 KW...

When you use a compromise antenna - something that you have to force the power into, or use a antenna tricker to make believe that all the power generated is being applied to the antenna - you can also make beleive that it is receiving all the signal in the atmosphere.

Unless the people you are talking to is very strong, you aren't going to hear them.. All goes back to the KDKA 718' tower and it's 50,000 watt transmitter.

Unfortunately - I ran across some morons the other night on 40 meters that was of the same opinion.. They were all using non resonant antenna's, tuners, and amplifiers.. Their signals were 20 / 9 or more and they were all proud of themselves that they could hear each other and that their signals were so strong..

On the other hand, I was using my Barker & Williamson BWD 90 antenna / 20' off the ground with 100 watts and they claimed that they could not hear me or hear me well.

They started acting like silly CB'rs and refused to adknowledge me..

When I informed them that they were not supposted to broadcast and that Part 97 rules says - you should use the LEAST amount of power to transmit and not the most - they got offended.

Well I have a 200 watt transceiver and I don't use any amplifiers and I don't use any antenna tuners and I never need more then 100 watts to talk to anyone. If I can hear them - they can hear me!

I wasn't going to brag, but I let it slip that it was the new Kenwood TS 990 and they started howling.. Something about it not being part 97 approved and that it was not for sale yet..

I never said I bought it, I just said I was using it!
Cranking it up to 200 watts - wasn't going to make my signal any louder

or stronger. We all know it takes 4 X power increase to get 1 S unit on the other persons receive...

A G5RV SUCKS!
It talks and receives on 20 meters and is a compromise everywhere else...

A Dipole antenna is 1/2 wavelength long and is a balanced antenna.
When one wave is in phase on the one leg it is out of phase on the other leg.
The two equals out and the antenna is resonant.

There are offcenter fed dipole antenna's that are multibanded - but they require a balun / torroid coil which is special wound and checked for tolerences which are not normally checked with commercial grade baluns.

YOU PAY EXTRA FOR IT!

From: eddy <eddy.ab0d619@radiobanter.com>
Message-ID: <eddy.ab0d619@radiobanter.com>
Source record: 711

I'm tuning a Cushcraft AP8 3,5-28MHz trapped vertical.
I check VSWR using both a MN2700 Drake Matching Unit that a MFJ259b analyzer. At the same connector readings are very similar on all frequency except on 10MHz.
On this band, 10.100MHz, MFJ259b shows 1:2,1 VSWR while MN2700 shows 1:6 VSWR. I replaced the MN2700 with a Daiwa CN801 which confirmed the high 1:6 reading to me.
Why shows the MFJ259 analyzer an incorrect reading on one band only ??
Many thanks

Sorry, that is false for most modern transceivers. If a transceiver is designed for 50 ohms (most are), when the system is conjugately matched with a 50 ohm Z0-match, transmitting and receiving are reciprocal, i.e. the system is conjugately matched (and resonant) on both transmit and receive. That means, in either direction, a low-loss system is transferring the maximum available power.

You can prove the above for yourself. Choose any system and adjust it until the transmitter sees 50 ohms. Disconnect the transmitter and install a 50 ohm dummy load at that point. Then go anywhere in the system with a grid-dip-meter and you will find resonance. Note that if one gets a dip on a GDO when coupling it to the antenna wire, it is working just as well on receive as on transmit.

> The two equals out and the antenna is resonant.

As I said earlier, a 1/2WL center-fed dipole is non-resonant without a feedline. An EDZ is non-resonant without a feedline. There's no difference.

To prove my point, it is recommended that to de-tune guy wires and keep them from radiating, insulators be installed every 1/4WL which makes each 1/2WL look exactly like a 1/2WL center-fed dipole with no feedline. Even in allegedly resonant antennas, the feedline is the thing that is resonating the system.

Excellent discussion. Thanks for all the expertise. I am still reading and learning and I take what you folks type and google it and read more about it and learn it. A lot of what you are saying immediately goes over my head, I am not an idiot, my master's degree is in another field, my graduate is in another field, and my undergrad and even college are in another field. Electronic theory is difficult to understand without the foundation you folks have, I am learning it and it is obvious you folks are well informed and knowledgable about antenna theory. Excellent discussion and thank you all so much for having it becuase I benefitting from it.

I am thinking that my best bet for a single antenna, dipole is the Bazooka? I don't want to have an array, or 3 seperate fan dipoles, or a back yard full of wiring as I am in a windy neck of the woods, property is very small also. The G5RV fits nice, now it has feed with 50ohm coax, I removed the ladder line from going through the wall and traveling along side a few other wires and replaced it with 50 ohm coax then meets the 450ohm ladderline (only one inch separation between the two coated copper solid wire ladder line). No choke or balun then exactly 30.6 feet of ladderline then 102 feet at the top. At about 40 feet in the air. Using the MFJ 2kw tuner and an old 1970 solid state transceiver, what better can I do? Without buying big.

But I love the depate we are having here on best and most suitable dipole for all bands, now lets hear some suggestions (clean) and recommendations. What is the best home made dipole antenna that I can tune to with this tuner, 10-80, barefoot, (I work code a lot) , clean, buildable, and hangable, it has to go over a couple trees which is no problem but if the wind starts spinning it and I have to keep climbing, too much maintenance.

Thanks again

73s

However, in your example, the KDKA tower is not used for receive. The tower
is used for transmit, and some marginally effective antenna might be at the
receiver.

If the antenna reciprocity theorem is assumed as correct, wouldn't a ham
radio antenna be just as "good" on receive as on transmit? And when the
transmit conjugate match is achieved, the transmit efficiency can be pretty
good. (subject to the size of the mismatch and the quality of components,
including feedline).

A Bazooka is a ton of hassle for almost no improvement over an ordinary dipole, just slightly wider bandwidth. For HF it's hard to beat a 130 foot dipole fed with ~100 feet of ladder-line through a good 1:1 choke on the output of a good tuner.

A G5RV is a good antenna for 80m, 40m, 20m, and 12m operation but also requires a tuner.

Why the 100 feet of ladder line? All I can do is 35 to 45 feet of ladder line? Now I am at 30.6 feet of ladderline with 102, The ladderline and coax now is fitting in its space, I could increase the spread to the 130 feet on next dipole if that improves the ability to tune it for lowest SWR through the MFJ989C Tuner. I think the tuner is big for barefoot operations. As I am having more difficulties now, the old solid state transceiver I am using has sat for so long without operation it barely pumps out 10 watts. A friend told me moisture must have took its place in some components and to leave it on for a couple days and I am noticing a bit improvement after one day so because the rig sat for so long without operation I think it needs to see a servicing doctor. I will leave it on for a couple days to see if it heals itself as recommended. Or I see there are new rigs available from 2m to 160, all band, all modes, and only about 12,000 dollars. No, I will hope this one recovers. There is no way I can pay anything like that. No way.
Thanks again, 73s

My guess(tm) is that there's something wrong or blown in your MFJ259b.
However, I can't tell if the VSWR meter in the Drake MN 2700 antenna
tuner is any better. A third VSWR meter, of known quality, would make
the determination.

First, check the MFJ259b with various known resistive loads.
1:1 50 ohm
2:1 100 ohm
2:1 25 ohm
1.5:1 75 ohm
etc...
A leaded resistor crammed into a PL259 will not do because of
excessive lead inductance. Use chip resistors or commercial loads. A
T connector with two loads is handy for less than 50 ohms.
If your readings are not fairly close to the theoretical value, it's
time for a repair job:
<http://802.11junk.com/jeffl/MFJ-269-repair/>
and/or a calibration:
<http://www.w8ji.com/mfj-259b_calibration.htm>
See bottom of page on how to build calibration loads.

Calibrating the Drake MN 2700 VSWR meter might be tricky. It's
designed to operate a high power levels and does not appear to have a
shielded VSWR section. Too much RF floating around the tuner and the
VSWR meter directionality will be affected, resulting in an inaccurate
reading. Since there's probably no calibration or adjustments, and
the unit is obviously not going to work with low power resistive
loads, I would simply try a 50 ohm dummy load and two dummy loads on a
T connector, to see if it reads correctly on a straight through
connection. Another method is to take a third VSWR meter between the
xmitter and the MN 2700. Keep the coax connection very short between
the meter and the MN 2700 to keep coax cable lengths from affecting

the readings. Use a double male PL259 "barrel" if possible.

These days I am doing a service my mobile station installation (VHF/UHF FM mode). What about to use a RF choke (ugly) balun at the feed point of antenna? (diamond NR-770s).

You are so right Channel Jumper,

The G5RV is a piece of s&%$ on any band but 20 meters. They are notorious for poor performance. They are only sold because they claim multiband performance.

If you want an antenna that works well you must look elsewhere.

BTW, I talk with a group on 75 daily. We have a regular round table. When someone jumps in with a very poor signal we always ask them what they are using for an antenna. The answer is that they are mobile or are using a G5RV.

OK, yes they work if you count operating your transceiver with an antenna that radiates on 75 about as good as a bed spring.

Michael

A 102 foot dipole is an efficient radiator on 75m with a feedpoint impedance of 36-j325 ohms on 3.8 MHz according to EZNEC. According to the transmission line loss calculator at:

http://www.vk1od.net/calc/tl/tllc.php

the G5RV feedline system has about 0.6 dB higher loss than a 75m dipole fed with an equal length of RG-8x. So the G5RV is about one tenth of an S-unit down from a 75m coax-fed dipole. Can you really detect one tenth of an S-unit difference with your ears? One tenth of an S-unit is virtually impossible to distinguish on most S-meters. It is generally accepted that one dB is the smallest difference detectable by human senses.

W8JI ran some interesting A/B tests involving a G5RV vs a 75m dipole on 75m. Most hams agreed that the dipole was better. Then Tom ran the same A/B tests but lied about which antenna was in use, i.e. he said it was the G5RV when it was really the dipole - and vice versa. Most hams agreed that the dipole was better even when the "dipole" was actually the G5RV.

> Why the 100 feet of ladder line?

When feeding a 1/2WL dipole, one needs to use about 1/2WL of ladder-line to repeat the low feedpoint impedance at the tuner. If one uses 1/4WL of ladder-line, the impedance at the tuner will be about 4000 ohms.

If you are happy with the G5RV, I would suggest sticking with it.

That's using the usual "commercial" version though. I wouldn't use one of those either. The tv line/choke/coax is the problem, not the antenna. If you use ladder line the whole run from the tuner to antenna, they will perform much better. The tuner setting can be critical too. You must use the least inductance required to get a usable match if you want the least loss. I tested this one time, and the loss could vary almost from nearly unmeasurable using the very least inductance, up to an easy 20% loss if you used too much.
In my case, I was using a 989C with a roller inductor, which lets me use the very least inductance.
If the inductor is tapped, there may be some compromise, but you still want to use the lowest value tap that will match.

Saying all that, I use full size dipoles in parallel fed with coax.. But I'm not expecting to work all bands, even though I can with a tuner. I'm on the higher bands so little, the hit doesn't bother me. I've got a tower and yagi if I really wanted to get serious about those bands.. But.. they collect dust in the garage and attic.. I'm on 160/80/40 most all the time.. I like 30m, but with 40/80 dipoles, using a tuner to band aid it to 30m works fairly well.

Then I think you'all should just use G5RVs and forget about using tuned dipoles or loop antennas. It just makes more band space for the rest of us when your signals are so far down they are little more than background noise. Best of of luck mates with your G5RVs.

Michael

What some people don't seem to realize is that a G5RV *is* a tuned dipole on 80m, 40m, 20m, and 12m. The twinlead is acting as a series section transformer to resonate the G5RV antenna system on those four HF bands.

I recently drove 30 miles to a local ham's house to see what was wrong with his G5RV installation. He had it installed as an Inv-V with about 45 degrees between the two dipole elements and had the twinlead section taped directly to the conductive support pole. He had no choke at the twinlead/coax junction and was trying to drive the G5RV from a solid-state transceiver using a built-in autotuner. Here are some rules-of-thumb for a G5RV installation.

1. Make it horizontal at a height of 40+ feet.
2. Keep the twinlead perpendicular to the horizontal dipole and away from any other conductor.
3. Install a broad-band 1:1 choke at the twinlead/coax junction.
4. Use a good grade of coax, not RG-58.
5. Tune the system with a good broad-range tuner.
6. Recognize that above 14 MHz, the radiation pattern is cloverleaf with not much broadside radiation.

While I am no fan of the G5RV, Cecil does bring up some very important
points. They must be installed correctly, just as with any antenna. They
do work most all the bands well enough if installed correctly.

I much perfer the Off Center Fed antenna. I do have to give up a few bands
with it as it is only about 130 feet long. It does work fine on 80 and 40
meters which is what I mainly put it up for. I do have an 80 meter dipole
at right angles to the OCF to compair it to, both at about 50 feet on the
ends and no middle support. No mater what the direction, they are often
about the same. Sometimes if a station is in just the right spot, one will
be much beter than the other. That is just on 80. A triband up at 60 feet
is mostly used for 20 meters. Usually it is much beter than the OCF, but
even at times the OCF is beter on 20 and 10 meters. Over the years, I have
came to the conclusion that almost any antenna compaired to another will be
beter in some case, but overall, some are beter than others most of the
time.

Well written post Cecil.

I don't know antenna theory or the math necessary for the understanding.
I just go on what has worked for me and for my friends.

I have a local mentor here who has very gently moved me from using a 75 meter dipole fed with coax to using a 75 meter loop fed with open wire balanced line.

I live right in town on a 100 X 125 foot lot. I have limited space. I also had a terrible noise level on my receiver. I am surrounded by homes and businesses. He coaxed me into putting up a loop antenna. This is a lot more trouble to do than a dipole. I had to ask a neighbour permission to put a corner of it on his tree on the edge of his property. This reduced my noise level several S units. I was thrilled. I was using 450 ohm window line to feed it. I was also surprised to hear that I was being received stronger in the 200 mile radius of our little

75 meter old men's gang we have. I did not understand why until I read a treatise on horizontal loop antennas.

I felt happy with what I had. Finally after much coaxing by the same mentor, I changed the 450 ohm line to open wire line. The difference in performance was profound. This makes no sense to me and my mentor does not know why this works, he knows from 40 years of experimentation that it does in fact work.

My noise level went down more. Now instead of my S8 meter reading with the dipole, I had achieved an average of an S2 reading on 75. This is my noisiest band. There are often days whey my noise level on 75 is S0. I always have S0 on 20, 15, and 10. I no longer need a tuner for 20, 15, and 10. My worst SWR on these bands is on 20 where it is 1.5:1. I have no idea why this happened. I can use my little ALS-600 and go anywhere on these bands without tuning. I use my AL80B for 75.

I could not understand why a loop reduced background noise so much. My mentor finally explained it to me in language I could understand. He found that I had once experimented with a 2 meter loop for direction finding. He said "remember how deep that signal null was when pointed at the station". I remembered. Well, he said " you are now pointing that loop antenna at all sources of noise coming in from the horizontal plane, namely noise from your town. You only receive signals coming in at an angle." Of course this is also why you lose the noise reduction if you put up your loop vertically.

Once you go loop you never go back :-)

Of course if you live in a rural area with minimal or no sources of local noise there is little incentive to use a loop. My mentor uses a 160 meter 3 element quad mounted with the top at 200 feet. Of course he drives it with open wire. He uses this antenna on all hf bands. He lives in a very rural area on 47 acres. He has spent a lifetime on this property and experimenting with antennas and constructing towers.

Then I think you'all should just use G5RVs and forget about using tuned dipoles or loop antennas. It just makes more band space for the rest of us when your signals are so far down they are little more than background noise. Best of of luck mates with your G5RVs.

Michael

That is not being E D U C A T E D.....

Think about a radio wave as being a real long piece of sausage..

Think about the size of the hog casing it takes to hold one pound of sausage.

You can make the casing real big in diameter, but it will only be one serving and will take a real long time to cook.

Or you can make the casing real long and it will make many portions.

If you only have 4 mouths to feed, and each person only wanted one portion, then making each link 1/4 of 1 lbs would give you the correct amount.

Now if you had 40 mouths to feed and you only have one pound of meat and you make 4 links - each person would only get a portion of a piece...

If your antenna is 20 meters resonant - a dipole being a half wavelength long, then when you have X amount of milliwatts of signal in the air, the tuner looks at it and as long as it can receive it - it will receive it and all is good.

If you take that same antenna and load it up on 80 meters, now it does not have a sufficient portion of the signal, unless the signal is 4 times stronger, for the tuner to receive it and process it and display it as receiveable...

Do you need multiple antenna's to do one thing? NO!

What you do need is one antenna that is resonant everywhere you desire to operate...

The Barker & Williamson BWD 90 does this.
Unless you understand how antenna's works - you will not understand what I am trying to tell you.

If it is resonant everywhere between 160 meters and 10 meters - because it is long enough to receive 160 meters, and everything in between, then it is a good antenna.

Transmitting is only a small portion of the job that the antenna does..
You can receive or transmit something on a wet / salty noodle if it is strong enough, but it is never going to be efficient.

You can use a 100 watt light bulb as a dummy load if you want, and it will resonate some of the power applied, and if the receive antenna is strong enough, the person on the other end, a couple of miles away will hear you.

But as I got into a fight with a educated dummy friend of mine, even though a 100 watt light bulb is a 50 ohm load, it is not a good 50 ohm load, because a light bulb is a non linear resistor.

All he cared was that he could use it as a temporary dummy load and it worked.

This is the same thing you are trying to do with your G5RV analysis.
Just because it works on 20 meters, and everything above 20 meters is a multiple of 20 meters, you think that it should still work.
But unless it is a half wavelength long, or multiples of half wavelength - it will not work.

Because it uses its transmission line as its matching network, you cannot connect a second matching network and match it to another frequency.

Anyone that thinks they can is only kidding themselves...

This is the reason why we call it AMATEUR RADIO, BECAUSE WE CAN EXPERIMENT AND SEE WHAT WE ARE DOING, AND SEE WHAT WORKS AND WHAT DOES NOT!

Even if you get it to work for a little while, sooner or later someone more educated then you is going to come along and tell you that it won't work.
Even when you show them your transceiver and your antenna and all the QSL cards you received - they will tell you not to do it - if they are educated.

When you show them the bill for repairs to your transceiver and your tuner, then they will get the last laugh.
And, when the people on 40 meters, who are doing the same thing you are doing tells you that they cannot hear you and that you must be on a G5RV and laughs at you - then they will get the last laugh!

Then instead of using a more efficient radiator, you will be looking for a amplifier, because you don't understand how your antenna works or what you need to do to make it work, all you understand is more power, which will only get you into more trouble in the long run.

Amplification is only used when all other attempts at using a more efficient radiator has failed.

All signals reduce at the square of the distance away.

The further away you get, the less perceived signal you will have.

If this is not true, then why can't I hear a AM commercial radio station in California at night with 10,000 watts with my $10,000 ham radio when I

have a 1000 watt AM station 100 miles away?

Actually, Channel Jumper,

All aspects of your station effect how well it is received. You need to start with a voice that is understandable. This can be a challenge for those hams who are disabled in that way. If you have a clear voice then you need a good microphone to pick up that voice. Then you need a transceiver that will convert that voice into a radio signal without distorting the audio. Then you put that output signal into an amplifier that does not distort the signal. Getting this done is an accomplishment in itself.

You then must have an efficient antenna. The antenna is most often some sort of compromise because most of us do not own acreage. Choosing the most efficient compromise takes some study and often help from another ham.

For those of us who use ham radio for rag chewing, running an amplifier is most often used. There is a good reason for this. Even if you can hear the other station through the static, you are likely missing part of what is transmitted. I am talking about the tone of voice and subtle inflections. Getting up to this level of high quality communications takes a lot of work and expertise.

Everything effects the quality of communications. Care must be taken at each and every stage. If you are using ham radio to talk with a group of friends within a 200 mile radius on 75, you want static free high fidelity sound. This means using a minimum of 1000 watts. This insures that everyone in the group hears everything regardless of their distance to the transmitting station. The square law of radiated electromagnetic radiation makes the use of at least a kilowatt very helpful.

There are those who claim individual elements of the station are the most important. They are most certainly mistaken. EVERYTHING counts.

Michael

The G5RV 102' dipole is 1/2WL on 468/102 = 4.6 MHz.

On 80m, 3/8WL of dipole plus 1/8WL of twinlead = resonance on 80m.
On 40m, 3/4WL of dipole plus 1/4WL of twinlead = resonance on 40m.
On 20m, 3/2WL of dipole plus 1/2WL of twinlead = resonance on 20m.

Yep, I've tried that here at the house. The more bands you add,
the better the chance of some odd multiple working out.
But lately, I've just been using the 80/40. The way I see it, I
can use the 80 legs as a pseudo EDZ of sorts on 30m.
It may be off from a 3/4 WL match, so a tuner is usually required.
But the losses are generally pretty low. As an antenna, the 80m
legs are pretty effective on 30m as far as broadside to the
antenna.
I've always been the same way with 40/15.. I've never added 15m
legs to a parallel set of dipoles. I've always used the 40m legs
for 15m. That goes back all the way to my novice days, when I first
started working 15m. I just used the 40m dipole. My first 15m
novice transmitter was a Viking Valiant. It would match nearly
anything I think.. Tuning 15m using a 40m dipole was no sweat at
all for it.
With my newer sand based rigs, usually need a tuner to keep them
happy. So even when I go up to the dirt patch, I stick a tuner in
the trunk, just in case I decide to take a walk on the wild side.
I've got a couple of smaller MFJ models I can take, and not have to
drag along the larger 989C. But I end up rarely using them..
When I'm up there, I'm on 75m 98.3 % of the time.. I don't get on
in the daytime, as I'm putzing around doing other stuff..

Like mowing grass.. :(
I'm going up there around the end of the month for a few days.
Lots of mowing to do :(, and I've got to rebuild my antenna.. :/

Hi
What happened to those two 989c tuners that was caused by the G5RV because I have the exact same set up right now. What happened to those dead units? Was there burn marks or melted fittings or warped coil blades? What would cause them to fail? There arn't any chips in there, looks pretty solid. And what if that feed point from the coax at the balun connecting to the 1" ladderline is only about 10 feet away from the radio? You mentioned 50 feet but I just can't do that. I am having tough time tuning, I wonder if my 989 has failed.

The usual failure scenario is the wire on the coil heats up,
and it melts the plastic form. Then the wire shifts outward and the
roller doesn't make a good connection.
This is how I got my 989C free.. A friend of mine was doing exactly
what you all describe. He was feeding a G5RV or whatever using that
tuner, and running an 8877 amp.. :|
He melted one coil, and replaced it with another MFJ sent him.
He melted the second one.. He then decided to get a Nye Viking, or
whatever, and gave me the 989C. I then carefully tweaked the coil
wires and adjusted it so the roller would touch, and it's been working
ever since. But I don't use it much.. It collects dust most of the time.

The usual MFJ stuff. Probably ok if you only run it about half what it is
actually rated at.
With the Alpha, he could have been running it over the MFJ ratings.

I have one of the low power MFJ tuners with the switch on the coil instead
of the rotary inductor. Bought it new at a hamfest from a dealer. Actually
I think I had to get a payment slip from the dealer and walk over to the MFJ
booth and pick it up from them. When I got it home, I had to go inside and
tigthen up the screws and install one nut that was rolling around inside it.
From the few MFJ items I have seen, this seems to be normal.

It seems to tune ok with a 100 watt rig, but the wattmeter is way off
compaired to two good meters and dummy load. Set it at 14 mhz and it is ok
for 20 meters, but way off on 80 and 10 meters then.

I probably would not have bought the MFJ, but I had just upgraded from Tec
to Advanced and did not see anything left in the flemarket. I needed a
tuner as the solid state rigs do not like to operate over all of 80 meters
as the antenna is not that broad.

Dunno. they are kind of cheap, but I guess they serve the purpose.
And you will often have to derate depending on the load..
Say trying to run a half size dipole.. Easy way to fry one if the
power is high.. I've got one of those little random wire tuners that
I've had since about 1977.. Still use it to this day.. Usually as

my mobile matcher.. I've also got another smaller one that has a tapped inductor. I forgot the #.. It's out in the garage. But it's a whole lot smaller than the 989C.. I think it does have a meter in it as I recall.
Most of the time I'm using a tuner, it's more of as a line flattener than anything. And that's only on the bands I'm not cut for.

URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

From: "J. C. Mc Laughlin" <jcm@power-net.net>
Message-ID: <TbGdnRFDn7mwBu7NnZ2dnUVZ_qGdnZ2d@bright.net>
Source record: 742

Dear Group: I expect to craft a common-mode choke for 50 ohm coax that works from 1.8 to at least 7 MHz using Type 31 (Fair-Rite) core material. Use of any Fe material in coax at the lower HF frequencies is undesired - no center conductors containing steel. Such coax should be able to tolerate being bent with a small radius to facilitate multiple turns through the core - no foam dielectric.

One such coax appears to be the expensive RG-400. Only need a few feet.

Question: What might be a source for short lengths of RG-400? I have tried Newark, Mouser, and the like. . . .

Question: What other small diameter coax uses no steel and has a solid dielectric?

Thanks. 73, Mac N8TT

Look here:
http://www.thewireman.com/coaxp.html

They list rg400 at about $ 2 per foot.

They may also have something you need for the choke.

2477. Re: One way shingles

Source record: 744

Back when the Michigan State Police used 40 MHz, at some posts static levels would become so high as to reduce range to almost nothing. Some say it was precipitation noise (as is common with aircraft) and some people believe it had another cause. It seemed to be weather related.

On 6 meters, with an AM circuit I had for years with my father, I have heard discharge noise that starts with a sequence of pops and progresses to a steady roar that occasionally would abruptly stop. (about 100 km path with yagi antennas at both ends)

My guess is it was due to local, enhanced noise. Effects may have been suppressed due to the nature of FM and its mode of squelching. 73,
Mac N8TT

Now the shingles have dried out we can hear each other on all the radios and antennas. I know nothing has changed as the radios need to be programmed by computer and I have the cable.

The distance is just under 10 miles so we should be almost radio line of sight. The land between us is rolling hils. Going from about 600 feet at the lowest to 900 feet at the highest.

Are you looking for low triboelectric noise or low piezoelectric coax?

RG58A/U also known as "Cheapernet". The problem is that I've seen it
with both solid copper center conductor, and cheaper copper clad steel
center conductor. It also only comes in polyethylene foam dielectric.
If it's solid dielectric that you want, you're stuck with Teflon.

For RG58A/U in Teflon, there's Belden 88240:
<http://www.belden.com/techdatas/english/88240.pdf>
which also has a solid copper center conductor.

There's a potential problem with using RG400 or any Teflon dielectric
coax in a torroidal balun. It might cold flow. The center conductor
might shove its way through the Teflon dielectric and short to the
shield braid. I've only seen this in smaller diameter RG188 Teflon
coax, but it might happen with RG400. I don't really know if it will
be a problem, but methinks you should be aware of the possibility.

<http://www.ebay.com/itm/380086386242>
** I will look at these sources. Ebay, well, it is Ebay. . . Thanks.

>Question: What other small diameter coax uses no steel and has a solid
>dielectric?

Are you looking for low triboelectric noise or low piezoelectric coax?
** Fortunately, mechanical forces will be tightly suppressed and thus these factors are not expected to be an issue. What are expected to be the two most important factors are a need not to have non-linear effects (no Fe and attention to avoiding braid issues - you are familiar with the extensive testing of harmonic production in/with some coax) AND a desire to minimize the probability of center-conductor migration (staying away from foam)
** A story from long ago: I saw center-conductor migration in RG8 type (solid dielectric) in a piece of coax that was in a horizontal, outdoor cable trough. This was a long time ago and it is possible that a manufacturing defect was involved. Today, one would scan the long piece of coax and discover such a latent defect if it existed.

RG58A/U also known as "Cheapernet". The problem is that I've seen it
with both solid copper center conductor, and cheaper copper clad steel
center conductor. It also only comes in polyethylene foam dielectric.
If it's solid dielectric that you want, you're stuck with Teflon.
** Thanks. I had just about reached the same conclusion.

For RG58A/U in Teflon, there's Belden 88240:
<http://www.belden.com/techdatas/english/88240.pdf>
which also has a solid copper center conductor.
** I had gone through Belden's info, but must have missed this entry.
Thanks.

There's a potential problem with using RG400 or any Teflon dielectric
coax in a torroidal balun. It might cold flow. The center conductor

might shove its way through the Teflon dielectric and short to the
shield braid. I've only seen this in smaller diameter RG188 Teflon
coax, but it might happen with RG400. I don't really know if it will
be a problem, but methinks you should be aware of the possibility.
** As always with your contributions, this observation is right-on.
Fortunately, volume is not excessively restricted and thus a somewhat larger
radius will be used than the minimum, which should improve the probability.
** Thanks for the help. You are a great source of useful information. 73,
Mac N8TT

Dear Ralph: Thanks! The Wireman certainly looks like a source for relatively short pieces of specialized coax. I have quite a bit of Type 31 on hand that I expect to use. Type 31 seems to be very useful for choking in the lower HF region.

The Wireman must be on my list of suppliers, but too many entries is the bane of the advent of the Internet <grin>.

Thanks again. 73, Mac N8TT

Good, fast, cheap. Pick any two.
eBay is fast and cheap at the expense of good. I buy quite a bit of
stuff on eBay and have had a good success rate. However, about once
or twice a year, I get a lemon. For cheap stuff like coax cable, it's
worth the risk.

PIM (passive intermod):
<http://en.wikipedia.org/wiki/Intermodulation#Passive_Intermodulation_.28PIM.29>
Also watch out for cadmium and nickel plated coaxial connectors.
Heliax and silver plated copper are the best so far. I recently spent
a weekend on a mountain top with a borrowed PIM tester.
<http://www.kaelus.com/Kaelus/media/Site/QR%20Code%20Files/PIM-Testing-Guidelines_Brochure
.pdf>
<http://boonton.com/products/pim-testers/pim21>
We had the time to go through almost every coax cable in the building.
According to the tester, with the antennas connected, everything
needed to be replaced. With the dummy load, most everything looked
much better. I eventually determined that we were actually measuring
rectification from nearby antennas and the tower. Banging on the
antennas with a mallet and tightening tower screws fixed that. Most
of the IM came from stainless fasteners on zinc plated tower hardware
which was later replaced.

For an RF polluted radio site, PIM testing is a really good idea.
However, I just don't see it being very useful for ham radio unless
you're doing something that requires full duplex operation.

>** A story from long ago: I saw center-conductor migration in RG8 type

I still use a home made TDR (time domain reflectometer) for testing
cables. Old habits and methods die slowly.

I usually have the opposite problem with coaxial cable. For example, I would solder connectors onto a 100ft roll of RG8/u while it was still rolled tight on the spool. Bad idea. When straightened, the center conductor becomes slightly longer than the shield. The stiff center conductor tries to push the center pins out from the connectors. In one case, I found a mangled N connector pair where the center pin had shoved its way into the mating receptacle.

I've seen what I suspected was center conductor migration on long horizontal coax runs, but have never done a post mortem on the coax. By the time it gets to the point where it's shorted, other problems (i.e. losses) usually inspire a pre-emptive replacement. These days, I just happen to have a roll of RG6/u with a messenger wire attached, which eliminates all the stresses.

Good luck, whatever you're building.

That noise sequence is exactly what I hear when I see a corn snow squall
come through my property in the winter. I have actually watched the wind
blown snow come closer and closer while the HF radio noise increases
until all signals are wiped out, then when the back edge of the squall
passes the antenna, all is quiet, again.

I live at 2800 ft in the Central Oregon desert. The antenna is either a
ground mounted 5BTV with 40 radials, or a 160 meter horizontal loop at
35 ft.

>> I still use a home made TDR (time domain reflectometer) for testing
>> cables. Old habits and methods die slowly.

>Do you have any construction information available for your TDR?

You can do this with a function generator (fast-edge square-wave pulses are what you want), possibly a resistive pad, a T connector, and a fast oscilloscope. I used this approach to test out and identify some poorly-labeled ham radio antenna cables at my city's EOC a couple of years ago.

Connect a BNC "T" junction to the oscilloscope's vertical input. To one side of the "T", connect a coax to a function/pulse generator that has a 50-ohm output (or use a low-Z generator and a 50-ohm series resistor pad). To the other side of the "T", connect the coax you want to test. Set the o'scope vertical sensitivity so that it covers 3-4 times the step voltage of the generator, and set the horizontal sweep rate to cover 2-3x the length of the coax you want to probe (figure 1 nanosecond per foot as a starting value, and triple it). Set the function/pulse generator for pulses that are at least twice the sweep length, and (if it's a pulse generator) a reasonable repetition rate (1 kHz or so). Set the scope for DC coupling, and set it to trigger on the rising edge of the pulse.

If the far end of the coax is open, and the coax is in good shape, what you should see during the sweep is an initial abrupt rise (to the generator's nominal output voltage), a flat trace for 2x the cable's end-to-end propagation time, and then an abrupt rise to twice the generator's nominal outut voltage.

If you terminate the coax in its characteristic impedance, the second rise won't occur (or you'll see just a tiny discontinuity at that point, if the termination resistor isn't an exact match). If you short the far end of the coax, the second rise will be replaced by an abrupt dive down back to zero.

Any wiggles or bumps in the first part of the trace (between the initial rise, and the reflection) will be the result of impedance discontinuities in the cable... damage, bends, connectors, conductor migration, etc. Measure the time delay between start-of-trace and wiggle, apply the cable's propagation-speed factor, and you can tell how far down the cable the discontinuity lies.

If you have a scope with dual sweep speeds and a sweep delay, you can "zoom in" on interesting sections of the trace and look at them in more detail.

If you don't want to lug a big pulse generator around with you, you
can build a small one which connects right onto the front of your
o'scope. A 555 driving a fast Schmitt-trigger inverter, a PIC with a
fast discrete output-driver circuit... there are probably about a
zillion circuits which would give a fast 50-ohm pulse that would work.

I actually have serveral. All you need is a pulse generator and a
decent oscilloscope. Pulse width and frequency will depend on the
length of coax cable you're trying to test.

These designs work well:
<http://www.epanorama.net/circuits/tdr.html>
<http://www.fccps.cz/download/adv/frr/Reflectoprobe/reflectoprobe.html>

This one is similar, but in my never humble opinion, not as good as
the previous one.
<http://www.mouthmusic.com/TEMP/aa6dd/Time_Domain_Reflectometer.jpg>

More:
<http://www.ecnmag.com/articles/2009/07/low-cost-high-resolution-time-measurement-applicat
ion>
<http://www.youtube.com/watch?v=jOUhg07N2-U>
<http://www.youtube.com/watch?v=Il_eju4D_TM>
etc.

Also look on eBay for a Tekronix 1502, 1503c or similar TDR.

I tried to buy one and was stung. Was told to send a Western Union payment and he reckons it never came, so $230 odd Australian. He virtually said in email he didn't receive the payment (told me himself it will be that day) and has written the transaction off the books. So, I'm down $230 odd for the experience and he won't return my emails now.

Steer clear of the so called TAK-tenna site, you won't get your antenna. So, all in all, can't tell you how it works.

That's not going to happen with my home made TDR. The speed-o-lite is
about 1ft per nanosecond. To see 0.1 inches, you'll need a resolution
of:
0.1in / 12in/nsec = 8.3 picoseconds
That can be done, but not with commodity hardware.

Have you measured or swept this antenna for the resonant frequency?
PVC pipe has a velocity factor of about 0.9 which will move minimum
VSWR point down in frequency. The amount varies with the diameter and
thickness of the PVC tube. The J-Pole antenna has a wide enough
bandwidth (about 10MHz for <2:1 vswr) that some change in tuning can
be tolerated, but I think a ham antenna tuned to 135Mhz is rather
tacky.

True, for most parts of the sky, except for directly overhead where the GP has a big null. You should get about 3dBi from both the GP and QFH antennas. The difference is that the QFH will not have any cross polarization losses, while the ground plane automatically has a -3dB loss from the conversion from RHCP (NOAA-19???) to linear vertical polarization.

>I have built according to plans,
>it is clockwize rotated and everything looks ok.....

According to what plans? Post the URL for the plans and a photo of your construction, especially the phasing sections. If there's any difference, someone will spot it.

>I use the same coax (switch antennas), but still, it won't work.

Hopefully, you don't have both antennas connected at the same time.

>Is there something I have missed??

Yep. What bird you're listening to, URL of construction article, numerical measurements of signal strengths, methods of comparison, mounting, lengths of coax cables, antenna pre-amp location, system description, etc.

Deja Vu. The last time I troubleshot exactly such a system, I found that the receiver supplied 5V bias for running an antenna mounted RF amplifier. The QFH antenna appears as a short across the antenna connector which clamped the 5VDC to ground, causing the pre-amp to act comatose. Running the system on a bench test looked perfect because the shorting antenna was disconnected. Adding a coaxial capacitor isolator between the RF amp and the antenna connector fixed the problem.

Hint: That what is mostly obviously correct, beyond any need of checking, is usually the problem.

>Do you think we have discovered one way shingles ???

Nope. You've discovered Fresnel zone diffraction, multipath
cancellation, and frequency selective fading. Congratulations.

>Anyone else seen anything like this ?

Not on 6 meters, put plenty at 900MHz and up. Basically, if you have
more than one path between endpoints, and the path lengths differ by
1/2 wavelength, you'll get cancellation. It's easy enough to detect
the problem by simply moving 1/2 wavelength toward or away from the
other endpoint and see if the signal levels change significantly. If
you can't do that, change frequency by the largest amount possible.

Also, if you live 15 miles apart, with antennas at about 15ft off the
ground, you're below the horizon. That means you're relying on knife
edge diffraction to communicate. That works, but is not reliable as
almost any metal object near the knife edge can send the signal off
into the wrong direction. At 6 meters, things like swaying wet trees
can do that. If the signals are NOT stable and tend to move around in
the wind, this might be the problem.

One way paths are possible. It's not the path. It's the antennas.
The basic assumption is that the antenna pattern is the same in xmit
and receive. That's a fair working assumption but not always true.
Different side lobes of an antenna can have a slightly different phase
shifts. If the two multipath signals arrive via the main lobe and a
side lobe in receive, and the side lobe moves slightly in transmit,
it's possible to achieve cancellation only in one direction.

If the 6 meter receiver has a noise blanker, he could be hearing so
much noise that the receiver acts like there's nothing to hear.

Many hams don't homebrew. They do not have to tools to do things like hams of the past.
It is often cheaper just to buy something already made. Say I was going to put up something like the G5RV. I have to buy some wire. The wire is just over 100 feet. That might mean buying 500 feet on a roll or ordering it with the postage. Then need some ladder line. Need about 35 feet. Have to get either 50 or 100 feet if I can find it locally, probably not any around now as most TV sets use cable or coax. Also insulators and coax to locate. Things start to add up. Or I could get it all in one 'kit' for much less.

Not all hams have a place to store supplies or build things that are large. I sometimes build and sometimes buy. I just bought something to program some radios off ebay. It was a circuit board with the parts on it. I did have to put it in a box. The board only had 1 IC and a few capacitors and leds on it. Two boards shipped was only $ 7.99. The shiping could have more than that at some places. I was going to order a VHF preamp kit but the postage put me off. They wanted $ 12.00 for postage. I could have put 50 of those kits in the $ 5.50 UPS mailing box. The kit was about the same as the postage.

Excuse my pedantry, but -3dB loss is actually a 3db gain.

How come nobody recommended the W5GI Mystery Antenna?

Many websites claim it to out perform the G5RV antenna and simple
construction.

I have to make one, any comments on which is better or worse? Have you folks
had luck with either or dissasterous results with one or the other? Is the
double boozooka better?

Thanks for any comments.

The construction is not as simple as the G5RV. Then there is the added cost and trouble to go to for the coax in the antenna legs.

I do not see any simple dipole really doing much beter than another in all directions. If you are lucky the antenna will be positioned so some of the gain will be in the desired direction. If not so lucky , then the antena will not work very well for you.

As long as the feedline is not very lossey and at the feed point the antenna has a low SWR, all around I still doubt that any antenna near the same length will be beter all the time.

http://vk1od.net/antenna/W5GI/ has an interesting analysis. The
conclusion seems to be that this antenna is basically similar to a G5RV,
and that many of the developer's claims seem to be unsupported by
actual measurements.

As I understand it, this antenna and the "double bazooka" both use
coaxial elements within the dipole section... variously described as
"resonators" or "phasing stubs". In each case, it looks as if these
coaxial stubs do contribute to the antenna appearing to be somewhat
more broad-band than would be expected of a simple doublet of the same
size... but that this broad-banded behavior is the result of losses in
the coax sections (either dielectric loss, or I2R loss in the
conductors). The Barker and Williamson broadband folded "dipole" is
somewhat of the same ilk... it's convenient to drive due to its
relatively flat SWR, but this is achieved at the cost of having a lot
of the RF power end up as heat in the termination resistor assembly
when the doublet itself is being driven far off-resonance (which is
much of the time, in multiband applications).

There's quite a lot of anecdotal support for the W5GI, the G5RV, the
B&W, and the double bazooka - a lot of people are happy with them -
but well-documented measurements don't seem to support the idea that
there's anything magic or unexplainable about them.

If you'd care to build a W5GI, and compare it "apples to oranges"
with other antennas of a similar size and report some measurements,
I'l sure we'd love to see your results!

Hi OM Jeff,

You are absolutely correct.

I have checked both the antennas in the range 140-150 MHz and find that
the J-Pole has minimum SWR at 145 MHz and the Slim Jim at 143 MHz.

Many thanks.

I've never tried one. And it's been so long since I looked
at the plans for it, I forgot exactly how it's built.
I know W5GI.. Used to talk to him on 40 about 20 years
ago. But I can't remember if he used that at that time or not.
I don't use the Bazookas. They are slightly more lossy than
a plain wire dipole. So never saw the point.. And they are
heavier too. Takes stronger supports.

"This design is unusual as the coil is not part of the radiator."

The base-matching coil on a 5/8WL doesn't radiate much because, unlike the base-loading coil on a 1/4WL, it is not located at a current maximum point which is located 1/8WL up from the feedpoint.

You can get all 40+ years of 73 magazine at:
<http://archive.org/details/73-magazine>
<http://archive.org/search.php?query=collection%3A73-magazine&sort=-date&page=1>
The Aug 74 issue is at:
<http://archive.org/details/73-magazine-1974-08> (33MBytes)
See Page 63. A steel rod for a whip antenna? I don't think so as
it's rather lossy:
<http://vk1od.net/antenna/conductors/loss.htm>

I'm also not so thrilled with the center tapped matching network. I've
taken apart several 5/8 wave loading coils and always found the coax
tap close to the ground end. The impedance of a 5/8" wave monopole
over a ground plane is probably over 500 ohms (too lazy to fire up
4NEC2 and check). For a 50 ohm coax feed, that would be an impedance
ratio of:
500/50 = 10:1
which is a turns ratio of:
sqrt(10) = 3.2:1
Move the 50 point closer to the ground end of the coil and maybe it
will work better.

I do not recomment 5/8 for mobile car 2m usage.
I had one and in the park garage the antenna would scratch along the
ceiling. When I did not pay attention, it would smash the fluorescent
lights. I had to drive in zigzag to avoid them (had a small car)
Driving fast, the antenna would bend down to horizontal like a straw.
Driving slowly, the antenna woud swing to and fro, and cause
horrendous additional fading.

There is only a theoretical gain over a lamda/4 and only a very small
one which you will never achieve in real world.

I am using a long wire in the trees coming straight to my tuner but I need to route the feed line underground to keep it stealth and I can't seem to find any articles on this topic.
My question...
I would like to use insulated wire or does it have to be coax only and would I lose performance?
Someone told this type of antenna would act as a lighting rod and would be dangerous.
My other question...
Why would it be more dangerous than any other antenna when most receivers and transceivers are grounded in some way?
Thanks in advance

Well you cannot bury open wire and expect any results. What frequency are you operating on? Are you transmitting? I think your best bet at this point is to bury coax and feed a dipole antenna if you are transmitting. Random wire antennas perform even worse than G5RVs. They are about the worst.

I have a 5/8 wave Maxrad on my Subaru Forester. If I hit anything,
the spring will prevent damage. If I hit something hard, the mag
mount falls off.

I've heard the broken fluorescent light story and find it improbable
with a thin flexible antenna. Many years ago, I did manage to break
an overhead fluorescent tube with a 102" whip antenna and a running
start. It took me about 15 tries to break it. Actually, I'm not even
sure if the antenna broke the bulb as one witness said that it just
fell out of the socket.

Take a fish scale, measure the force that can be obtained by bending
back a 5/8 wave 2m antenna. I have no clue where my fish scale is
hiding so I can't do the test. Next, take a string or wire and wrap
it around the middle of a fluorescent tube. Pull on the wire with the
same force as the antenna bending. I'll wager you what's left of the
Ramsey CT-2000 frequency counter that I just blew up by plugging in a
positive ground charger, that the tube won't break.

>There is only a theoretical gain over a lamda/4 and only a very small
>one which you will never achieve in real world.

<http://www.arrl.org/forum/topics/view/91>
Length gain, angle, gain at 10 degrees
1/4-wave 0.4 dBi 23.5 degrees -1.6 dBi

1/2-wave 0.6 dBi 17 degees -0.4 dBi
5/8-wave 0.5 dBi 13.5 degrees 0.2 dBi
3/4-wave 4.7 dBi 46.5 degrees -3.0 dBi
1-wave 4.7 dBi 32 degrees -3.7 dBi
That's about 3dB (including the matching network losses) or twice the gain of a 1/4 wave whip. My personal experience with our local 2 meter repeater is that I can use the repeater effectively with a 5/8 2m antenna, but not with a 1/4 wave antenna.

I'm not sure I agree with that statement, I have used a g5rv in the past and I have had great success throughout the years with a random wires, end-feds, long-wires etc. The trick is to have a good ground when using a random wire.

Im in a situation where I need to bury the feed-line to a random wire (end-fed type) antenna and Im looking for the best way of doing this.

If you came here for advice why are you arguing with the first person
that responded?

Just go ahead and do what you (mistakenly) think is true just because it
seemed to work OK.

And it's "I'M" not "Im". At least learn the language you speak.

Wow, a newsgroup cop and an English teacher!

BTW it's I'm and not I'M, but I won't tell you to learn the language you write.

I very much respect and appreciate the "first person's" opinion and my apologies to him for not expressing that before but it is just that, an opinion, just like mine. I did not think a difference of opinion could be called an argument.

My disagreement "not argument" really had little to do with my question about burying the feed-line, not which antenna works best.

I am pretty sure by now this thread has gone south thanks to your watchful eye on correctness, sensitivity and diplomacy on this group but anyway,
I would still like to hear from anyone with some advice on burying a feed-line.

You can not burry a single wire feed to a long wire. When the wire leaves
the transmitter/tuner it becomes part of the antenna. If you have to use a
long wire and a burried transmission line, you need a remote tuner and go
from the transmitter to the tuner with coax. Even if you use open wire/twin
lead for the transmission line, you need to keep it several inches from the
dirt. Almost impossiable to do. It will not make any differance if the
wire is insulated or not if it is under ground.

No. not a newsgroup cop, just wondering why the first response to you
was disputed. And I held the cap key down too long. It happens.

He's pretty much on the nose though in his comments. If you can make a
G5RV or random work, it's mostly luck. Yes, with end fed proper
grounding helps a lot, but it's still a crap shoot.

As I understand it, the modeled gain of a 5/8 monopole over a 1/4
monopole, usually includes the assumption of an infinite ground plane.

The body of a typical car isn't large enough to act as a good
approximation of an infinite ground plane at 2 meters. If you
actually model a 5/8 monopole over a small ground plane such as a car
root, you'll likely find a not-very-nice-looking pattern... the gain
lobes tend to "squint" away from the horizontal and you lose much of
the theoretical gain advantage of this antenna.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Probably depends where you mount it though. All the times I've
compared the 5/8 vs the 1/4, the 5/8 would be superior to farther off
stations. But.. I always planted the antennas in the middle of the car
roof. In the real world, I found the 5/8 did the best on far off
stations, which tends to confirm some gain over the 1/4 was there
at the lower angles. The 5/8 also tended to picket fence less.
Me thinks the roof and supporting pillars tends to provide a fairly
decent lower element for the 5/8. Or at least good enough that most
people that try and compare them will go with the 5/8.
There are some instances where the 1/4 might be better though.
Say if you were down in a valley, and the repeaters are way up high,
fairly nearby. The broader pattern can sometimes work better in that
case.

With the height of my usual HF antenna, the height of the 5/8 2m antenna on the roof was never an issue.. lol..
Anyway, I always achieved some of that gain in the real world. And ditto for most 5/8 GP's at the house vs 1/2 and 1/4 wave antennas. The 5/8 always won to the farther space wave stations across town despite the theoretical issues.

The situation described certainly does seem to be one where a remote
automatic tuner would be the best solution (plus a good ground, of
course). To minimise interference problems to-and-from the domestic
electrics, it would normally be better to locate the tuner at the far
end - although this would entail having a longer run of coax.

Hi OM Dave,

In my experience a ground plane antenna, whether 1/4λ or 5/8λ
, scores over other 'horizontal radiating' or 'gain' verticals when the
signal has to go over terrain to work distant repeaters.

Many thanks for your views.

73

And make it an inverted L while you're at it! I'm just about to order an SGC239 auto ATU for my inverted L (www.radiowymsey.org/invl.htm). My coax lies on the ground but only because half the garden is patio and steps.

Charlie.

Getting a G5RV or a 'random' wire to work isn't 'mostly luck'. It's more
a question of simply knowing what you're doing.

Hi tom,

I have been a ham since 1955. I have experience trying different types
of antennas. At one point (10 years) I designed antenna installations
for Raytheon Co.

Those who have not compared their random wire or G5RV to a good antenna
figure it is working just fine.

I can say that I know that if you want a dipole to work on multiple
bands, it needs to be a full 1/2 wavelength on the band you want it to

work on. Feeding it with open wire and a tuner will allow some decent performance on bands that are higher in frequency. I am guessing Tom that you already know this.

My favourite antenna for living in the city on a lot surrounded by homes and industry is the horizontal loop fed with open wire. This does a great job of nulling horizontal noise from the town.

Many hams just look at the 102 foot spec for a G5RV and works all bands and say great. If they can talk to anyone they figure it must be perfect. It is not actually a bad antenna on 20 meters. However, the performance on 75 is abysmal. I work 75 most of the time and when I hear a new guy come on in our area with a weak signal we all figure the guy is running a G5RV. This is usually the case. We always nudge him in the direction of putting up a decent antenna.

The only time a random wire makes any sense is aboard ship or boats. If you can make a solid connection to the sea water you have a decent antenna. BTW a decent connection on a non steel or aluminum vessel is 30 square feet of copper plate on the outside of the hull.

It is hardly worth my time to talk with anyone who already figures he knows all about antennas because he has used a G5RV and it works fine. We need to reserve our comments about what really works for those who are actually interested in improving their station operation and have not taken the attitude that they are already experts. :-)

There is a guy here my age who has experimented with antennas much more than have I. He nudged me into changing my 450 plastic dialectrict balanced line to my loop to an open wire. I did not expect much difference. I was shocked at the improvement. He is our resident expert in the "North Woods". This is the Michigan upper peninsula, Northern Wisconsin, and Minnesota. He is not an expert on antenna theory or math, but damn sure knows what works best. I wish I had changed my feed line three years ago when he told me to do so.

Michael

I am in a situation where I HAVE to bury the feedline, there is no other way around it. I have trees about 20 feet away from my home in the back, great for swinging a long wire, dipole, whatever works but being that the actual space between the trees and my home is a common area, I have to bury the coax.
Placing a remote tuner on the other side would be a bit of a hassle but I see its starting

to look like the only way to go?
I got plenty of time, I just want to do this once and the right way.
Again, any thoughts appreciated and thanks to all who have posted, it is turning out to be a very interesting thread.

It looks like you will have to use either a remote tuner, or something you
can feed with coax. Maybe a trap type of dipole.
While I have no idea how they would work, you may want to check out some
from DXS Engineering.
http://www.dxengineering.com/search/department/antennas

For some of the low bands I use a homade OCF antenna patterned after the
Carolina Windom. But I also have other antennas up for some of the bands.

Live in the Minneapolis metro and just got back from the lower peninsula
last Monday. Was camping next to the lake in West Olive. Used my usual
portable HF antenna, a 20m end fed. I also have a 40/20 end fed, but
didn't figure it was worth the trouble for this trip since I was going
to be busy with other things at the site and I didn't know the campground.

You probably know the rule here - if you put it up at 20 below it will
never come down.

I don't have any of the math for you. However, I know what works and what does not. You probably do not listen to your own G5RV. Its poor performance is pretty clear to anyone who listens to you. However, if you have an emotional bond with your G5RV, I would not want to be the cause of any alienation in your relationship. Keep using it. The low effective radiation makes for more band space for the rest of us. The signal just disappears into the noise level.

Better yet just put up a random wire and a water pipe for ground. You can get a perfect match with a tuner. It will work better than the long wire the guy wanted to bury in the ground :-) In fact I recommend you try burying your G5RV and make a stealth G5RV. It will still load with a good tuner.

However, if you were actually interested in improving your transmitted and received signal, you might tune around 75 and listen to those stations putting out a big signal. Especially in the daytime when band conditions are bad. Ask someone with that big signal what antenna they are using. If they are using a G5RV then you are right and I am wrong.

I doubt if many will choose to use a G5RV when they can put up a
'better' antenna, and it's unlikely that the stations putting out really
big signals are using one. However, subject to an appreciation of its
characteristics and limitations, it can usually be made to perform
reasonably well.

Regarding the use of shorter-than-halfwave dipoles, the following
writings of W8JI (and the included links) are worth a read.
http://www.w8ji.com/short_dipoles_and_problems.htm

I've had a quick look, and it seems that the main cause of poor
efficiency/performance is that as the dipole is progressively shortened,
the increasingly high SWR causes high losses on the feeder. Cunningly

minimise the SWR, and you can still have a reasonably efficient
radiator.

It may also be useful to look at one of G4FGQ's programs - 'Dipole3'. If
you enter zero feeder lengths, this gives a quick assessment of the
efficiency of the dipole alone.

> I don't have any of the (G5RV) math for you.

Allow me to provide it based on EZNEC simulations and VK1OD's transmission line loss calculator. The G5RV will be compared to a 127 foot coax-fed dipole, both at a height of 40 feet and both antenna systems resonant at 3.72 MHz.

The 127 foot dipole has a maximum gain of 6.42 dBi at TOA of 90 degrees.
The G5RV dipole has a maximum gain of 6.06 dBi at TOA of 90 degrees.

The 127 foot dipole has a gain of 4.65 dBi at an elevation angle of 45 degrees.
The G5RV has a gain of 4.37 dBi at an elevation angle of 45 degrees.
The dipole beats the G5RV by 0.28dB

The 127 foot dipole has a resonant feedpoint impedance of 59 ohms at 3.72 MHz.
The G5RV has a feedpoint impedance of 33-j355 ohms at 3.72 MHz.

For 30' of RG-213, the 127' dipole has 0.093dB loss.
For 30' of 300 ohm twinlead, the G5RV has 0.89dB loss.
The 127' dipole beats the G5RV by 0.8dB

For another 50' of RG-213, the 127' dipole has 0.175dB loss.
For 50' of RG-213, the G5RV has 0.241dB loss.
The 127' dipole beats the G5RV by 0.066dB

The 127' dipole beats the G5RV by 1.15dB which is 20% of one S-unit. Human ears can barely detect a 1dB change.

So please explain to us how one signal that is 1.15dB lower than a second signal can "disappear into the noise level" and why your ears are so much better than the ears of normal homo sapiens.:)

Some hams think that -1.15dB on 75m (20% of one S-unit) is a rational compromise for an antenna that also works well as is on 40m, 20m, and 12m.

Random wire and water pipe was what got me hooked. Now I have lots of land behind my home for a real nice long wire but I cant get the wire across to my property :(

Dear "gipy" (no call sign provided):

From what you have written, you must get a transmission line across a "common area" (of something like 20 feet) to a long piece of property that you control, and the only acceptable scheme is to bury the TL. For a transmitted signal (I am assuming that you might be a radio amateur) a buried, single wire TL of only 20 feet would result in little signal reaching an antenna - so such a TL is counter-indicated. One could support a twin-wire (two parallel wires) TL within a buried, larger-diameter "plastic" conduit for 20 feet and not loose much, however you would have to craft a scheme for supporting the twin-wire TL in the approximate center of the conduit and the installation is likely to be provocative to other users of the common area. So, coax it is. To have the coax have little loss you must use BIG coax or not let the SWR get too large. By stages, arrive at the conclusion you stated that the way to go is to use coax with a good quality, autotuner at the far end (and a good ground). One can use a spade (or one of many other tools including a larger knife) to slit the soil and insert coax.

You will find it instructive, once you know the geometry of your long-wire to use a computer program like EZNEC to get an idea where lobes are expected. After you install, let the group know what you did. 73, Mac N8TT

At my location I receive static-type QRM across the 2m band with either of my antennas (a 1/4λ Ground Plane 15m high & a Slim Jim 10m high). As it's not present at night and on weekends I presume the source is commercial.Very strong signals override the QRM but with weaker signals its a nuisance.When I connect both the antennas to the rig through a 'T' connector, the 'S' Meter reading drops but the QRM disappears and the audio level goes up considerably.SWR is 3:1 with both the antennas connected.73Nandu.

Look into vertical antennas with a cardiod pattern. I use these for
direction finding, but they also are good for putting a notch in one
direction (such as a co-channel interfering repeater).

Basically, it's two IDENTICAL antennas, spaced 1/4 wave apart. Put a
Tee connector on one antenna. Run 1/2 wave electrical length coax
between antennas. The feed coax goes to the other port on the Tee
connector.

4NEC2 has such an antenna in its sample antenna collection. Look for:
C:\4nec2\models\HFvertical\CARDIOID.NEC
C:\4nec2\models\zz_EZnec\v3.0\Cardioid.nec
Note that the frequency is 299MHz which yields a wavelength of exactly
1 meter. You can use that to scale the antenna to any convenient
frequency. After a quick run through the optimizer, I got a F/B ratio
of about 50dB, which should be deep enough to null out your noise
source. However, if the signal is bouncing off of nearby buildings,
and arriving from other directions, this is not going to work.

2542. AM but no FM on Timex T311 clock radio - Single Wire antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2012-10-20 07:07:17 UTC
From: goldenhound104@gmail.com

Source record: 609

Not sure if this is the right group, but here goes.

I have a Timex T311 clock radio. Seems like it used to get FM, but now all I get is a single statiky station across all FM frequencies. Uses a single wire antenna about 20" inches long.

Pulled it apart and the wire is connected to a board. The placement of the wire is hard to see, with a blob of hot glue on the connection.

Is the antenna broken, or something else? Curiosity more than anything.

Thanks in advance for any help!

>the interference.

I don't believe in luck, but have been known to rely on it. In this
case, I've built several cardiod pattern antennas for direction
finding and for unwanted repeater notching. They work.

However, I screwed up in my comments. The antenna spacing can be
almost anything as long as the DIFFERENCE between the phasing line
delay and the antenna spacing is a multiple of 1/2 wave, so that they
cancel. In my original comment, it should have been 1/4 wave spacing,
and 3/4 wave electrical coax cable length.

One problem with such designs is that they are very frequency
dependent. My guess(tm) is that the usable bandwidth of the notch at
2 meters is about 200KHz. At any other frequency, the notch depth is
somewhat lacking. It also doesn't solve the noise problem if a
different style antenna (i.e. anything direction) is used.

>There are both designs and commercially available
>interference cancelling devices that take the signal from the main
>antenna and a second 'noise' antenna, and adjust the phase to cancel the

Yes, that's what he wanted. I was proposing a simple alternative.

Antenna noise cancellers. HF only:

>wire antenna about 20" inches long.

According to the FAQ, that's the FM antenna:
<http://www.timexaudio.com/faqs.asp?Productid=10108>

>Pulled it apart and the wire is connected to a board. The
>placement of the wire is hard to see, with a blob of hot glue
>on the connection.
>
>Is the antenna broken, or something else? Curiosity more than anything.

Break off the yellow goo. Find a 20" piece of wire, and connect it to
where the the antenna attaches. If it works the same, it's not a
broken wire antenna. I can't tell from here what is broken. My
guess(tm) is that it's something else. Since you can hear one
station, the FM receiver is functioning and just lacking in
sensitivity. That would mean a problem with the 20" antenna or the
receiver front end (RF amplifier section). Since it's probably an all
digital receiver, it's probably something blown in the AM/FM receiver
chip.

Hi OM Jeff,

Yes, I should check that.

Trials with a 2-element vertical array and a Moxon (both homebrew) were
unsuccessful.

Many thanks.

Just spin the antenna around until the noise goes away. That's the
way it works in a direction finder. The only luck that would be
required is to hope that the noise source and the station he's talking
to are NOT at the same bearing. In that case the antenna would notch
out both the desired signal and the noise.

However, we're both assuming that the noise is being radiated by a
point source. If it's being conducted through the power lines,
there's no single direction that could be nulled. The noise will
appear to be coming from all directions. The cardioid notch antenna
will be totally ineffective. The antenna noise canceller might still
work (not sure).

AC power in India is not the best. I'm not surprised that there may
be some "industrial" noise:

Hi OM Jeff,

I think it's not powerline noise. A 2-element array/a Moxon have
confirmed that it's from a point source.

73

Nandu

P.S. I am indeed horrified by those photographs!

If that's true, and it's coming from one specific direction, then the
cardioid antenna pattern should have reduced the noise level. My
guess(tm) is that you did something wrong with the construction of the
antenna. Did you test for a notch with a local repeater at a know
location? Just spin the antenna around. If you get a null in the
direction of the repeater, it's working. If not, something is wrong
with the antenna. If you do get a null, play with the antenna spacing
to produce the deepest notch. Note that you will need to retune if
you change frequency.

The one at:
<http://tinyurl.com/9dn3xfm>
is truly amazing. Everything is a ground level. Barbed wire at the
base to keep the kids from riding their bicycles under the
contraption. The dolly wheels are still attached to the bottom of the
transformers, which appear to be welded in place. There's a small
platform nearby which appears to be a cell phone charging station. It
looks like this thing in parked in front of someone's front door. Is
utility power really this bad in India, or are these photos just
atypical horror stories for the benefit of the media?

I don't know for sure. His comments were:
"Trials with a 2-element vertical array and a Moxon (both homebrew)
were unsuccessful."
I assumed that the "2-element vertical array" was a genuine cardioid
notch type array built in the manner I described. Perhaps not.

Want me to post the NEC2 deck and resulting patterns?

Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted twice monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:
```

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Hi OM Jeff,

You are absolutely correct. Mine is a 'chance-phase-cancellation' setup.
It's proven, since the noise returns when either feeder length is
incremented randomly.

What be the result of stacking two (theoretical) isotropic antenna.

If the output from two (theoretical) isotropic antennas was to be combined in phase and measured would there be a gain? And if so where is the gain coming from, I'm thinking of the distorted balloon model to explain antenna gain.

Regards

Peter

Welcome To Cheap NFL Jersyes Store!We the promise to you:GREAT QUALITY + FAST SHIPPING + ENTHUSIASTIC SERVICE = 100% SATISFACTION.
1.Men and women jersey free shipping order over 10 Pieces(can be mixed).
2.100% recycled polyester.
3.designed for movement.
4.Player's name and number.
5.Strategic ventilation for breathability.
6.Player's number sewn on the shoulders,upper back and on the front of the jerseys.
7.NFL Equipment patch patch sewn at the point in the front.
8.Good NFL Jerseys Shop.
We have the size S to XXXXL,But we have to distinguish a point:our NFL women jerseys only have the size from S to XXL,and the man is M to XXXXL. We hope you select the right size. Thanks for your cooperation.
Our NFL jerseys shop must have a jersey which you like. You can also look other NFL football team jerseys such as NFL custom jerseys and NBA custom jerseys, Jeremy Lin jerseys and so on online. Hope you have a happy shopping from now. 2012,Go!

2564. How to feed an existing folded dipole.

Newsgroup: rec.radio.amateur.antenna
Date: 2012-10-26 13:30:45 UTC
From: Tom Horne <hornetd@gmail.com>
Message-ID: <fc4f9967-3ddf-4fdc-a4a3-aaab0df0207d@c20g2000vbz.googlegroups.com>
Source record: 629

I have a folded dipole coupled to the feed line with an Icon AH4 antenna coupler. That has worked rather well for me in my rather random pattern of operating. The folded Dipole is a Barker & Williamson BWD-90 from which I removed the Balun and the center resister. I then shunted the resisters previous location. I had been feeding the modified BWD-90 with window line from the terminals of the AH4 coupler so as to allow the antenna to remain more nearly flat. With the weight of the balun, the terminating resister, and the coax on the center of the antenna it drooped quite a bit. I took out the resister because so many people told me that I would never know if I was getting a decent signal out or just warming up the resister. If I should not have shunted out the resisters previous location I would appreciate not just "don't do that" buy why it is a bad idea.

My problem is that I would now like to use a Yaesu FT-1000 that a fellow club member has loaned me and I have no way of controlling the AH-4 because the adapter that I was using with my Yaesu FT-857D will not work with the Yaesu FT-1000. I am open to any suggestions providing that they can be done in a yard that allows me only a ninety foot span between supports. I suppose I could save up and buy a new coupler but I was hoping for something a little less costly.

Should I give up on using the modified BWD-90 for now and put up another antenna? I could buy a fan dipole I suppose but I need a way to feed it that does not require a heavy balun up at the feed point if possible.

K someone please

Hi
I got myself an old Alpha Delta DX CC now, it is old, very green. coils look green also.

I want to rewind those coils or even rewire the entire thing.

This is the 82ft no trap 80 through 10 dipole. Also includes 12, 17 and 30.

Any advice from the group? I see the coils are using a much thinner wire, new ones look nice and copper, this one is very green.

What size wire can those coils be? Can I just continue the copper length for the 80m leg and instead of separate copper winding just use the same copper and wind it around that winding core?

With the coil is the critical factor its length or number of coils?

Any advice from the group is greatly appreciated

73s

82' No Trap 80 thru 10 Dipole.And it is great ALL bands. This includes 12, 17, and 30.

Many of the chokes used to stop hash from switching power supplies use
ferrite rods with a couple of dozen turns of heavy copper wound around
the rods. Is this what you need?

I have the Ferrote Bars, just wondering what to do with them. Be nice.

I figured I could use them as some type of choke, wrapping them around the coax right near where I soldered it to the ladder line. This will keep all RF at the antenna and not bring back any.

But I use barefoot anyway, do you think it is necessary? I do not have an amplifier.

Just wondering if anyone has made any chokes this way.

Thanks

You need to know the material or the characteristics of the material to get a valid answer.
"Transmission Line Transformers", by Sevick has some information on the subject.

I use old radio ferrites rods as RF chokes as it is easy to wind leads around them if there are connectors at each end. They are also easy to add in-situ and I have cured/reduced computer hash by creating chokes by winding leads around a ferrite rod. In another instance I had trouble with breakthrough on my Rotel amp when running 100W SSB on 40m. Winding each speaker lead around a ferrite rod near the amp output cured the problem.

Charlie.

There are a lot of variables here. Most of which I do not understand. I have enough experience to know that the number of turns in the coils is most important and the diameter of the coil is important. If you use the larger wire for the coils it will likely take a large coil form. You can certainly use the same wire for the whole antenna. I am just thinking that if they used thinner wire for the coils, you will not be able to get enough turns on the form to get the same inductance.

If I were in your place, I would use some insulated stranded #14 house wire for the whole thing. I would also buy some pvc pipe to allow the same number of coil turns (and same diameter). If it worked fine before

you started this project, copying it wire length for wire length and turn for turn would be my plan.

Michael

Hi,
Yes you are very correct. The entire system apparently is working condition so why not just leave it alone. That is ok.

But it is 16 years in the air and very green, coils are green. When looking at the photos online the new ones while exactly the same design are beautiful copper with a clear protective wrap around those coils. Mine doesn't have that wrap and those coils are very green. The coils are smaller diameter wire, looking like the transformer wire with that sholack on it but then there are soldered connections back to the larger diameter bare copper green wire running to the insulators.

I would have to make another core if I were to wind the same new copper wire right from the center feed point to the ends of each leg. That would be basically the only difference other than instead of bare copper wire (new stuff) I have a big coil of solid copper wire with a jacket, I think it is 16ga. I was hoping to simply replace the exisiting bare green copper wire and the green coils with new copper wire with the jacket.

So do you think the changing of the coil wire diameter but keeping the same number of wraps is the way to go? Or because the new copper wire has the jacket, this will change the number of wraps if I measure the length of the old coil wire.

Lot of hardware in good shape on this old antenna, I just want to change all the copper.

Thanks for the advice,

73s

Hi
Ok, so you are talking about wrapping the feedlines around the ferrite bars, they are pretty thin, maybe even 1/4" or 5/16", I was thinking of wrapping the ferrite bars around the wire by breaking them into 1" lengths then line up about 4 of them and just tape them around the coax where it feeds into ladder line to stop rf from coming back and to ensure the antenna acts like an antenna.

I see ferrite chokes online for cheap price so I just get a few of them as they look solid (two solid halves) and they wrap around the coax.

Just thought I could use these bars but doesn't seem practical when they are so cheap for a half dozen of them online.

Throw it away.

Make a dipole for the longest frequency you desire to operate on.

Formula is 33 / 66

Make the one leg 33% of the length of the frequency and make the other side so that when combined to the first leg equals 66% of the total length for the dipole.

A true Dipole is a half wavelength at the center cut frequency.

I use the term dipole loosely - because it is a non terminated antenna that has two sides...

It will then be resonant somewhere on all frequencies above the center cut frequency as long as the Q of the coil is high.
Don't use a low Q coil balun...

Any break at all in ferrite reduces the permeability quite a bit. Even
super gluing broken ferrite back together makes a noticeable reduction.

So, you idea won't work for what you are trying.

Thanks Channel Jumper,
but not sure which frequency I would most operate on. So with the tuner I have I want suitable access to as many as possible. I think rebuilding the DX CC is ok for what I want to achieve.

Do you know what is the critical points regarding those coils? I found out the copper wire coil I have is 12ga and solid, 300meters of it, it has a nylon jacket with a plastic layer around that. Regular industrial stuff. So regarding those coils, could I simply replace that thinner transformer wire with windings of the same 12ga solid in jacket that will comprise of the rest of the dipole? Is it length of that coil's copper (badly oxidized) that is critical or is it coil turns? The present diameter of those coils is much smaller than the 12ga, so should I make new coils with that thinner transformer wire and make two solder connections there or can I simply weave the 12ga in its place? What would you recommend in this situation because I want to rebuild this good dipole with new copper.

Thanks

73s

I'm not sure if this will be helpful or wanted.

But your dipole antenna needs to be resonant - 1/2 wavelength on the
lowest frequency you desire to operate on.
Because most amateur radio frequencies are multiples of other
frequencies - 10 / 20 / 60 / 80 / 160
Some wavelengths will work with one antenna - as long as you do not try
to tune up on a non resonant frequency.

This is the problem with the G5RV
The ladder line is the matching network and it only works on 20 meters.
When you try to tune it up on 10 or 40 - it tries to damage the tuner -
arcing and heating.

At the same time, some will not be feasable - even with the tuner - such
as 12 / 15 / 17 / 30 / 60

It does no good to transmit if you cannot hear.

I'm a recycle and reuse man :-) Also at HF you will need a few of the
clip-on ferrites for each lead as the impedance of one 'turn' will be
pretty low compared to a dozen or so turns a round a rod.

Like the G5RV that you dislike, if one removed the feedline from a 1/2WL resonant center-fed dipole, it is no longer resonant. Resonance implies a low resistive feedpoint impedance. The G5RV antenna system has a low resistive impedance looking into the series matching section on 75m, 40m, and 20m (also on 12m).

3/2WL dipole + 1/2WL feedline = resonance on 20m

3/4WL dipole + 1/4WL feedline = resonance on 40m

3/8WL dipole + 1/8WL feedline = resonance on 75m.

> The (G5RV) ladder line is the matching network and it only works on 20 meters.

Here's technical proof that it also works on 75m and 40m.

http://www.w5dxp.com/G5RV.HTM

The Smith Chart SWR arc indicates how series section transformers really work. The G5RV is a reasonably good antenna on 75m, 40m, 20m, and 12m. Not so good on 15m and not good at all on 30m, 17m, and 10m. A ZS6BKW is a better choice to obtain 17m and 10m but one loses 75m.

The G5RV antenna system is what it is. It is neither a gift from Heaven nor a design straight from Hell.

I made the G5RV and I am receiving a lot of RF in the shack. I also have installed infloor heating in many parts of the house and while trying to tune, I trip the GFI thermostats, I believe that is coming from the G5RV. Channel Jumper mentioned that before that it was a dirty transmitting antenna. Now I am learning and installing ferrite rods (wrapping feeds from my power supply aound the 3/8" x 6" Ferrite Rods. I am going to wrap about 5 rotations and tape them up. Seems practically all I can do. Which is better? The ferrite bars to be wrapped around, at the ends of the feeds from power supply or the RF chokes that simply clamp onto the cable, two halves coming together? Any tips there are helpful.

Also, I landed an old Alpha Delta DX CC, now this was in the air for about 16 years and is very green. I want to rewire this antenna in hopes it performs best. My question is about those coils. Do I have to find the transformer wire which is smaller guage than the 12 ga wire I have to wind those coils? Or can I simply replace those green tranformer wire coils with the 12ga copper wire that I am using to replace all the legs of this fan dipole? I am just basically duplicating the dipole's engineering, but not the coils. I am wondering about those coils, do they need to have that shalac tranformer smaller guage wire with two soldered connections or can it be wound by the 12 ga copper wire and not have those two soldered connections. One wire for the entier leg and have it wound around that coil core.

What is the critical point here? The length of the wire or number of wraps on the 1-1/4" tubing they used? Or are they the same anyway? Would 50 coils of 12ga be the same length as what looks like 22ga? Same distance?

Thanks for the great discussions

Like the G5RV that you dislike, if one removed the feedline from a 1/2WL resonant center-fed dipole, it is no longer resonant. Resonance implies a low resistive feedpoint impedance. The G5RV antenna system has a low resistive impedance looking into the series matching section on 75m, 40m, and 20m (also on 12m).

3/2WL dipole + 1/2WL feedline = resonance on 20m

3/4WL dipole + 1/4WL feedline = resonance on 40m

3/8WL dipole + 1/8WL feedline = resonance on 75m.

> The (G5RV) ladder line is the matching network and it only works on 20
> meters.

Here's technical proof that it also works on 75m and 40m.

http://www.w5dxp.com/G5RV.HTM

The Smith Chart SWR arc indicates how series section transformers really work. The G5RV is a reasonably good antenna on 75m, 40m, 20m, and 12m. Not so good on 15m and not good at all on 30m, 17m, and 10m. A ZS6BKW is a better choice to obtain 17m and 10m but one loses 75m.

The G5RV antenna system is what it is. It is neither a gift from Heaven nor a design straight from Hell.

Do you have a husky 1:1 choke balun at the twinlead/coax junction? Are you limiting your operation to 80m, 40m, 20m, and 12m? Is your G5RV high enough and far away enough from the shack to avoid radiated RF overload? Is your G5RV twinlead at least a few inches away from anything conductive? Is your G5RV dipole section horizontal?

If you answered "no" to any of those questions, we might have a clue as to what is the problem.

Unfortunately that is not proof. Proof is when you compare a tuned dipole on say 75 and a 102 foot G5RV side by side with a switch to a simple 1/2 wave dipole. Actual testing like this is required. Mathematics and graphs are simply that, mathematics and graphs. Those little plots assume that there are no other variables that have not been considered or even discovered.

Every time I hear a poor signal breaking into our conversation on 75, and I ask what is their antenna? You guessed it, a G5RV. I always ask during any qso what antenna they are using and at what power.

No, it is not a design from hell. It is just a poor excuse for a multi-band antenna. A trapped multi-band dipole will work better from my experience and I don't like trapped multi-band antennas. The only antennas that sound weaker on 75 than the G5RV are the random wire antennas and a vertical using about 4 or 5 buried ground radials. So, the G5RV is a step up from those horrible antennas.

The G5RV is only gotten popular because it is cheap to buy and easy to erect. Performance is very difficult for most ham operators to ascertain because they have nothing with which to compare their G5RV. Many hams will give someone who is weak a 5/9 reading just to be congenial. They are not doing the other operators any favours doing this. I always give my peak s meter readings. This is certainly not a great standard, but is honest on my part.

So, Cecil, I think you need to erect a simple 75 meter dipole and a coax switch. See what the other guys says about your two different s meter readings on 75 meters. This must be done at different time of the day and night a often. Keep a log of the results.

Michael

No need for me to do that, Michael, since Tom, W8JI, has already done it and reported the results. He had an A/B switch between a 1/2WL 75m dipole and a G5RV at the same height. He ran two tests:

1. He told the truth about which antenna he was using for the QSO. Most of the hams on the other end of the QSOs agreed that the 1/2WL dipole was superior.

2. He lied about which antenna was which. Most of the hams on the other end of the QSOs agreed that the 1/2WL dipole was superior. But since W8JI lied, they were really agreeing that the G5RV was superior. Were you one of those hams?:)

No Cecil, I was not. I also would have given my s meter readings regardless of what I thought it should be. It is important to me to give my fellow hams as much good data on their antenna work as possible. I also agree that the hams that are asked about which antenna is sounds better should not know which antenna they are rating. I have a friend who has an inverted V dipole at 200 feet and a double bazooka as an inverted V at 75 feet. He is 100 miles away and the lower antenna is always the biggest signal. This does not make sense to me, but that is what is actually happening. The angle of both antennas are the same. We always need to measure actual performance and not paper performance.

I still think you should do this yourself. Just ABing the receiver is an important test. G5RVs have a reputation that I cannot personally confirm of being noisy. I do know for certain that some antennas produce more noise than others.

My loop does a wonderful job of nulling out the noise from my neighbour's homes and local industry.

On another list, populated by people with good guessing skills, poor memories and so on, the question of where did the RG numbers come from?

The most popular answer told with the most auhtority is that RG stands for "Radio Guide", as a device, the predecessor to wave guides.

I was under the impression, and may have read from a better source that it does indeed stand for Radio Guide, but that was a tile of a book.

Is that the case, are we all wrong?

If it is from the title of a book, does anyone have a link to, or can send me a (scanned?) copy of it?

TIA,

Geoff.

Geoff-

One problem I've found when researching old information on the internet, is that history appears to have started with the internet's invention. There is a lot of old printed data that may never be typed into machine-readable form unless someone needs it.

This is the first time I've heard this explanation of RG. It was my understanding that RG was a relatively arbitrary military designation. You will find other designations related to Co-ax connectors such as UG. I'd look for older military documents that listed various other designations, such as ARC-5, BC-459, et cetera, where each letter has a meaning related to the equipment's use.

I doubt that "guide" was used prior to microwaves. Co-ax has two conductors. A waveguide has a single "conductor": its inside wall. In other words, it appears to guide the energy rather than conduct it.

I've spent many years experimenting with G5RVs including field strength measurements vs a dipole and a vertical. When someone has a problem with a G5RV on 75m, it is invariably because good engineering practice was not used in that particular design and installation. An inverted-V at 15 feet with no choke/balun and twinlead taped to a conductive pole and/or laying on the ground is certainly not going to work very well. With both antennas properly designed and installed, it is difficult to tell the difference at resonance on 75m. However, the G5RV is fairly non-functional on 30m, 17m, 15m, and 10m. 17m and 10m are necessities for me and that's why I don't use one. I bought a G5RV in the late 80's expecting it to live up to its all-HF band advertising and I was disappointed. That's when I went to my no-tuner all-HF-band 130' dipole.

http://www.w5dxp.com/notuner.htm

Like any dipole where the two dipole elements are DC isolated from each other, the G5RV is susceptible to precipitation static. An RF choke across the conductors will solve that problem.

You were VERY lucky that it worked the first time.
Be sure to check your transmit VSWR as it will change with two
antennas connected with a T connector.

Maybe those who chose a G5RV to buy something cheap and easy also then erect it poorly. I have seen a G5RV erected in my town here. It looks awful. It works just as well. I talked to another ham a few days ago on 40 meters. His G5RV was mounted at 10 feet. Some guys actually wind their window line into a coil.

I also saw another antenna in town. It was supposedly a 75 meter zepp. It had 6 feet of window line and then a 60 of wire wound around a single tree. I am always amazed at the lack of planning and engineering that go into some antenna installations.

These guys will never have a good signal and probably never know why. Most will not ask for help because they already know that their antenna is great. I don't know why some hams will have their self-esteem tied up in their rigs and antennas. I mostly use an Icom 751A and I know it is not the best rig in the world. It is old and needs repair once in a while. My 75 meter loop at 35 feet of height is not the best antenna in the world, but it is the best I can do for height given my trees and property. However, I listened to someone who knew more about antennas than myself and he convinced me to change my window line feed to open

wire. I got a huge benefit in performance. It does not make sense to me that a plastic dialectric is so much worse than air. Maybe it is the change from 450 ohms to 600. But boy did that antenna start working better.

Michael

The current consensus is that it means "Radio Guide" and that it was a
big heavy printed book called "Army-Navy List of Preferred Cables" as
part of MIL-HDBK-216. The problem is that nobody I can find has ever
seen such a book or offered a scanned image of at least one page.
<http://www.avsforum.com/t/1433989/rg11-compression-connector-installation#post_22497621>
Note that the book was dated in the early 1960's. I believe coax
cable was in use with the RG designation long before 1960. Methinks
the whole thing is rubbish.

2nd best is "Radio Grade", which simply means that it's suitable for
use on a radio. That begs the question why it would be necessary to
even have such a designation, making that rather improbable.

My guess(tm) is that it's someone's initials or a combination of the
last names of the draftsmen that were charged with documenting the
cables. Coax cable was invented at AT&T by Lloyd Espenschied and
Herman Affel in about 1928 or 1929, a patent issued in 1931, and
commercialized in 1941. My guess(tm) is that the RG designation
appeared somewhat after commercialization and sales to the military
during WWII.

Original coax cable patent.

Hi OM Jeff,

Yes, I sure was!

You're correct - SWR is 3:1 with both the antennas connected.

I will get down to rigging a proper setup very soon.

Many thanks.

If the IMpedance is wrong, and the VSWR is 3:1

That means that the power has to travel up and down the coax 3 times
before it is radiated.

If the coax is 50' long, 50 ohms and the frequency is 146 mhz and the
loss rate is 3 DB in 50'.
Then you loose 9 DB of signal in each direction. transmit / receive...

So by knowing this - we now know that your antenna is not resonant -
which is the reason why it is quieter - because it is not receiveing
anything.

If we had to divide the frequency to get the antennas resonance to match
50 ohms - we now end up with a antenna system that is resonant somewhere
around 70 MHz...

Sounds like you need to do a little more research before you post your
findings on here.

The proper solution is to make phasing lines out of 75 ohm coax and get
the two antenna's back in phase with each other.
The one antenna is cancelling the other out.

There's evidence that Oliver Heaviside patented a new arrangement of two conductors that would include co-axial in 1880, in a British patent numbered 1407. I haven't found a FOC source for downloading a copy of that patent but there's reference to it on the web (e.g. by Googling 'heaviside coaxial cable patent'). Google Books has 'Oliver Heaviside: The life, work and times of an electrical genius of the Victorian age' in which Page xvi refers. I didn't spot any reference to such prior art in the AT&T patent but, of course, they may have had no knowledge of something patented across the pond 51 years earlier ... particularly before the advent of under-sea co-axial cables!

However, where I used to work we had an extensive set of transcriptions of the work of Heaviside (Heaviside. O. Electromagnetic theory. Benn Brothers Ltd., London, 1922) and when I tried to research Heaviside's condition for a distortionless line (G/C = R/L) I was bogged down by an awful lot of waffle and found it impossible to determine what he actually meant by 'distortionless' - some say absence of dispersion, I thought absence of a limited frequency response. So, sacriligeous as it may seem, I wonder if the US patent is actually the first one about co-axial conductors that anyone other than the patentee actually understood!

<Channel.Jumper.ad71198@radiobanter.com> wrote:

>If the IMpedance is wrong, and the VSWR is 3:1

Yep. Assuming two perfect 50 ohm antennas (won't happen, but it's fun
to imagine perfection), in parallel give a 25 ohm load. That's a:
50ohm / 25ohm = 2:1 mismatch.

>That means that the power has to travel up and down the coax 3 times
>before it is radiated.

Nope. That's not the way it works. VSWR is simply the ratio of the
load impedance to the system impedance. On a non-leaky system,
reflections create standing waves, with voltage peaks and nulls that
can be measured and used to calculate the VSWR (or reflection
coefficient).

There's nothing in the formulas to suggest that VSWR has anything to
do with the number of "bounces". Were your statement true, then I
would assume that after 3 bounces, the signal would magically
disappear. That doesn't happen because the signal is not a lump of
RF, or some quantity that has a finite beginning or end. It's a CW
(continuous wave) signal, that is being produced continuously (as long
as the power is applied), producing standing waves. What RF is being
reflected by the load, is being bounced back to the source
continuously and therefore never disappears (until someone pulls the
plug).

In addition, there's really only one bounce. If you assume that the
xmitter source impedance is 50 ohms and the line impedance is 50 ohms,
then when the reflected signal bounces back to the transmitter,
there's no mismatch. Therefore, the xmitter absorbs all the reflected
power, and does not send any of it back to the load again. This is
why transmitting into a short or open causes so much trouble with
transmitter output stages. The reflected power equals the source
power, and all of it has to be dissipated in the output stage. Were
the reflected signal be able to bounce back for a 3rd pass (as you
claim), it would really be wonderful because no excess power would be
dissipated in the xmitter output stage.

>If the coax is 50' long, 50 ohms and the frequency is 146 mhz and the
>loss rate is 3 DB in 50'.

Loss is not a rate. Loss does not change with time. You don't read
about dB/minute. There is dB/ft, but that's not a "rate".

>Then you loose 9 DB of signal in each direction. transmit / receive...

Nope. A VSWR of 3:1 is a return loss of 6dB.
Return-Loss = 10 log (Pin / Power-reflected)
(Pin / Power-reflected) = 4:1
So, with a VSWR of 3:1, for every watt that gets transmitted, 0.75 watts gets radiated by the antenna, and 0.25 watts gets reflected back to the transmitter, where it is absorbed and dissipated as excess heat by the power amplifier (assuming 100% efficient antenna, loss less coax, and 50 ohm xmitter output PA).

>So by knowing this - we now know that your antenna is not resonant -
>which is the reason why it is quieter - because it is not receiveing
>anything.

It's not receiving the noise because the combination of the two antennas has produced a null in the antenna pattern conveniently pointed in the direction of the noise source. Presumably, signals from other directions work somewhat normally.

>If we had to divide the frequency to get the antennas resonance to match
>50 ohms - we now end up with a antenna system that is resonant somewhere
>around 70 MHz...

Nope. If that were true, then 4 bay stacked dipole collinear antennas would not work. Each dipole is tuned to the operating frequencies. Put 4 of them on a pole space 1/2 wave apart, add a tangle of phasing coax cables, and you have an antenna that is resonant exactly at the same frequency as the individual dipoles.

>The proper solution is to make phasing lines out of 75 ohm coax and get
>the two antenna's back in phase with each other.
>The one antenna is cancelling the other out.

That's what he's trying to accomplish. He's trying to put a null in the direction of a local noise source.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

The both halves of your antenna work in each cycle as the radiator and next
as the counterpoise.
For the counterpoise the bare wire is better than the insulated.

Maybe he needs to get with this man and come up with a whole new theory on
swr.
http://www.youtube.com/watch?v=zOOihiLLS4I&feature=related

I see that much progress has been made on the SWR theory from the time I
passed the First Class Radiotelephone back in 1972. Kraus was wrong :-)

Ah, but if it were true, it would certainly be useful. Since a short
circuit can produce infinite VSWR, the signal would bounce back an
forth an infinite number of times. Just transmit some RF into a
shorted piece of coax cable, unplug the trasmitter, replace the
transmitter with another short circuit, and you have an "RF power
Storage Bottle(tm)", with the signal bouncing back and forth forever.
When you need some RF, just uncork one end of the coax cable, and out
comes the stored RF.

Well, to be (uncharacteristically) honest, one doesn't need a magic
reflecting VSWR theory to build my perpetual RF motion machine. It
would be easy enough to just put a T connector half way between two
pieces of shorted coax cable. Apply some RF to the T connector,
disconnect the transmitter, and cover the T connector. The RF should
bounce back and forth between the coax end points forever. All one
needs is lossless coax, superconducting lossless conductors, and
lossless vacuum dielectric. I don't think a cork would be necessary.

Hello Jeff.

I wonder how long it will be before lossless coax, superconducting lossless conductors and lossless vacuum dielectric become a reality?
What other, currently theoretical, components could we make use of? I like portable operating so I'd go for an AA cell that can hold at least 100 Watt hours of power. I'd settle for a soldering iron that can melt solder but is well enough educated not to burn me when I grab the wrong end.

73 Ian.

Hi,
I am blessed to have the DX-CC land in my lap, but used and soon will need rewiring. Any advice on those coils? Can they just be re-coiled with the same wire all along? I have a large coil of solid copper wire that is 12g with the plastic jacket with a uv thin sholack. What are the recemmendations for the coil turns and lengths of that coil wire?

or am I better off replacing those coils with exactly the same size enammeled copper wire with two solder joints? Same as the manufacture does. Would they just do it this way to speed up the process? Make it easier for mass production?

If I were to wire that top leg all same wire including the coils, is that preferred? Any ideas as to the specs for doing it that way if you guys think that is electrically more logical? Or not?

Thanks

73s

Room temperature super-conductors are a possible solution.
<http://en.wikipedia.org/wiki/Room-temperature_superconductor>

>What other, currently theoretical, components could we make use of?

The list is huge. Just about any device that is plagued by IR losses
would benefit. You can already by superconductor wire:
<http://www.suptech.com/hts_wire_overview.php>
The RF application is superconducting wire and ceramics for low loss
cell site filters and front ends:
<http://www.suptech.com/superlink_850.php>

Superconducting power transmission lines are being tested:
<http://en.wikipedia.org/wiki/Electric_power_transmission#Superconducting_cables>
In theory, the energy necessary to keep the transmission lines cold is
less than the energy loss that would be produced if they were made
from the traditional aluminum conductors.

>I like
>portable operating so I'd go for an AA cell that can hold at least 100 Watt
>hours of power.

Different animal. 100 watts for how long? We're talking energy here,
as in Joules or watt-seconds, not just power in watts. I can easily
give you 100 watts to heat your soldering iron, but only for a few
seconds. If you want to use it for more than a few seconds, you'll
need more energy, or more specifically, more energy density.
<http://en.wikipedia.org/wiki/Energy_density>
(It might be helpful to know that 1 kw-hr is 3.6MJ). Just pick your
energy source and calculate how long it will run a 100 load. For
example, the AA alkaline battery holds 15,000 joules and will run a
100 watt load for:
15,000 watt-seconds / 100 watts = 150 seconds
which will never happen because the internal resistance of the battery
will first will convert much of that energy into heat. You're
probably better off soldering with something that is converted
directly to heat such as a butane soldering iron, rather than being
converted to electricity as an intermediate step.

Incidentally, the only difference between a battery and a bomb is the
energy density. As you climb up the table towards increasingly larger

energy densities, you rapidly approach a weapon of mass destruction.

>I'd settle for a soldering iron that can melt solder but is
>well enough educated not to burn me when I grab the wrong end.

No problem. See:
<http://en.wikipedia.org/wiki/ColdHeat>
This soldering iron tip has so little thermal mass that it heats up
and cools down very quickly. Touch the tip after soldering, and you
won't get burned.

Lossless transfer of RF energy through a superconductor would violate the laws of physics. From "Fields and Waves ..." by Ramo and Whinnery: "A perfect conductor is usually understood to be a material in which there is *no electric field at any frequency*. Maxwell's equations ensure that there is then also no time varying magnetic field in the perfect conductor. ... Unlike the ideal collisionless conductor, *losses occur in superconductors* at nonzero frequencies and non zero temperatures."

I've finally found the last of my QSLs from my period as a SWL of the ham bands (1977 and 1983-85) and have been loading them into my computer.

I have a question of prefixes- one country in particular- East Germany.

A typical EG call would be Y23AZ. Now, is the prefix Y2 or Y23?

If it still works, I see no real need to rewire. The green coating is not going to hurt anything, unless it's so severe the wire is rotting away. Or if the coating causes a short between windings for some reason. If not, I would just use it as is.
But if you really feel compelled to rewire it, I would use the same exact gauge solid wire that was originally used. That way you can use the same forms with no design changes.

2618. LF Antenna Design

Newsgroup: rec.radio.amateur.antenna
Date: 2012-11-04 00:30:11 UTC
From: rickman <gnuarm@gmail.com>
Message-ID: <k74cus$p45$1@dont-email.me>
Source record: 585

I am looking to build a LF antenna for a home built WWVB receiver and have found a number of antenna designs. The ones that might be best look like shielded loop antennas. Here is a pretty good page showing construction of one.

http://w5jgv.com/rxloop/index.htm

I will be looking to get as large a signal out of the antenna as possible without using a preamp. From what I can tell, I will want to use as many turns as possible, limited by the upper frequency of the antenna. I assume this is because as the cable gets longer the self resonant frequency drops.

Am I headed down the right path? The only other antenna I have found for LF work is a ferrite core coil antenna, but my impression is that they don't pick up as large a signal. That is somewhat mitigated by the fact that nearly every crystal radio that isn't connected to a long wire is connected to a ferrite core. These are powered by the received signal itself, so it must pick up some decent signal. Then again, I think they mostly pick up local stations without a very optimal antenna, no?

I'm interested in any sources of info that might help me in my planning.

Rick

It is possible to have zero losses in a DC steady-state superconducting system that is free of collisions, i.e. no particle acceleration. However, RF (AC) guarantees particle acceleration and collisions which are a type of friction.

Oh, so that's what you were asking in sci.electronics.design.

>The ones that might be best
>look like shielded loop antennas. Here is a pretty good page showing
>construction of one.
>http://w5jgv.com/rxloop/index.htm

Yep. Loops are good. However, there are smaller, cheaper, and
possibly more appropriate antennas available if you have a fairly good
signal. That's the real problem. At 60KHz, the atmospheric noise is
sufficiently high to bury even strong signals. Worse, the propagation
varies with the time of day.
<http://tf.nist.gov/stations/wwvbcoverage.htm>
<http://tf.nist.gov/tf-cgi/wwvbmonitor_e.cgi>
<http://www.febo.com/time-freq/wwvb/sig-strength/index.html>
Adding more antenna gain does nothing as it increases the received
noise and signal equally. The ratio (i.e. SNR) remains the same.

That's possible, but preamps solve lots of problems. The big one is
the impedance match between the loop and the receiver input.

>From what I can tell, I will want to
>use as many turns as possible, limited by the upper frequency of the
>antenna. I assume this is because as the cable gets longer the self
>resonant frequency drops.

Sorta. What really happens is that you can build an antenna for size,
bandwidth, or gain, pick any two. Building a larger antenna will
yield more gain or more bandwidth (but not both). The little tiny
ferrite loopsticks are the same, lacking in either gain or bandwidth.
>
>Am I headed down the right path?

Dunno. I'm not sure what you're trying to accomplish and what
limitations on cost, size, weight, power, etc are involved.

Hey gang, i was working on my full wave horizontal 80 mtr loop and decided to add either an "ugly balun," or possibly a dx engineering 1:1 balun. The antenna is abt 275 ft long and is currently just fed directly with coax, and I use it for 10-80 operation with a tuner.

Obviously, i like the cost of building an ugly balun, but will it work as good as the 1:1 dx engineering balun? Thanks in advance.

Here's some information: http://www.karinya.net/g3txq/chokes/

As you can see, there are none of the air-core baluns that work very well 80m-10m because they are narrow-banded. Note that 25 turns is not enough turns for 80m and too many turns for 10m. Compare the bandwidth of the ferrite toroid baluns to the bandwidth of the air-core baluns. (We might define that bandwidth as any color except red, i.e. any frequency where the choking impedance is greater than 1K ohms.)

Hey Jeff,
I did some searching for info for him but didn't find a lot on just a
loop resonant at 60 Khz. I was looking for turns and capacitance but
found no designs.
So I think he needs to pick a size that he is comfortable with and
calculate turns somewhere between 100uh and 200 uh and find some
polystyrene 10,000 pf caps put 4,5, or 6 in parallel and then find a
large air variable to fine tune it with. (135uh and 5000pf is resonant
at 60khz) Then he needs a matching pickup coil, I've seen a small coil
about 1/5 dia. of the larger coil used. There are other methods.
Should he use coax? Wrap it with foil when complete? (with gap)
You're thoughts? (maybe more uh's?

kb8viv, you need to give use some idea on the physical size you can
tolerate. also, are you sure you don't want a preamp?

You would likely get better results if you did a specific Google search,
i.e. WWVB antenna.

There are lots of articles out there specifically for WWVB antennas
and receivers.

Here's some:

http://www.febo.com/time-freq/wwvb/antenna/index.html

http://www.ka7oei.com/wwvb_antenna.html

http://www.moorepage.net/Loop.html

http://www.creative-science.org.uk/MSF3.html

Here's some information: http://www.karinya.net/g3txq/chokes/

As you can see, there are none of the air-core baluns that work very well 80m-10m because they are narrow-banded. Note that 25 turns is not enough turns for 80m and too many turns for 10m. Compare the bandwidth of the ferrite toroid baluns to the # bandwidth of the air-core baluns. (We might define that bandwidth as any color except red, i.e. any frequency where the choking impedance is greater than 1K ohms.)

Nice link.

> You're thoughts? (maybe more uh's?

Ok, let's do the math (for the 2nd time as my PC crashed in the middle
of the first attempt).

The loop antenna is basically an impedance transformer. To feed with
50 ohm coax and no preamp in the antenna, the require turns ratio is:
(main-loop-turns / 1-turn-coupling)^2 = Xl-main-loop / 50 ohms
Using your 0.01uF tuning capacitor, which has a reactance of:
Xc = 1 / (2 * Pi * Freq * 0.01uF) = 265 ohms
At resonance, the inductive and capacitive reactances are equal.
Plugging in, I get a turns ratio of:
sqrt (265 / 50) = 2.3
which isn't very practical for a loop antenna. To get a higher turns
ratio, a smaller cap will be needed. For example, with 1000pF, the
reactances are 2600 ohms for a turns ratio of 7.2, which is somewhat
better. The main loop and the coupling loop would need to be rather
close together. No problem with a ferrite core, but not very
practical with an air core shielded loop. You could use your 1/5th
size coupling loop (as is used in a magnetic loop HF antenna), but at
60KHz, efficient coupling will not happen. The loops need to be
physically close (or wrapped around a ferrite rod). However, a tapped
loop would work if you insist on not using a preamp.

The more common way is to use a preamp at the antenna. It's purpose
is to amplify the received signal, but also to deal with the loop to
coax impedance conversion. See the schematic at:
<http://www.ka7oei.com/wwvb_ant_1_1.gif>
Note that the amp if connected directly across the main loop. The
0.4uF tuning cap yields a reactance of 6.6 ohms, so the 1K amplifier
input resistor will have no effect on Q. I would have used a smaller
capacitance, but since the author elected to use a bipolar xsistor

instead of a FET, the lower reactance will result in a smaller voltage swing and will help prevent clipping.

Then, there's bandwidth or Q. The main loop will probably require about 15ft of #26awg wire according to some of the construction articles. At 0.041 ohms/ft, 15ft = 0.6 ohms.
Unloaded Q = Xl / R = 265 / 0.6 = 440
So, the -3dB bandwidth of the loop will be:
60Khz / 440 = 135 Hz
Since the bandwidth of WWVB is about 700Hz, that should work. It will never really have a Q of 440 due to loading and losses, but that should give a clue on how critical the tuning might become with a huge, single turn loop. Incidentally, I was aiming for a Q of about 5 on the LORAN antennas which was required because the 100KHz LORAN signal is 20KHz wide. Loops were possible, but amplified whip antennas were much easier to deal with.

Thanks for the reply. At this point I may just forego the balun all
together and continue to just feed theloop with coax. Thanks again es
73's.

This may be a wrong assumption. This antenna will be very close to the receiver and this is a home brew receiver, not a commercial one. I can make the input impedance anything I want really. I am looking at directly driving a high impedance input on the ADC. Is there some reason to work with a lower impedance for a very short run?

BTW, I have seen loop coupled antenna described but one of the pages I found talked about the complexity of correctly coupling the antenna to cables, not just impedance, but the balanced/unbalanced issue. This web page seems to talk about it pretty well.

http://www.w8ji.com/magnetic_receiving_loops.htm

The page I refer to in my original post uses a toroid transformer to couple the output to the antenna rather than a loop. I like the idea, but I have no idea how to calculate the number of turns on the toroid. His app was for 50 ohm cable and a higher frequency than mine.

http://w5jgv.com/rxloop/index.htm

I think this guy did a lot of research in designing his antenna and was very skilled in building it.

I'm a bit unclear on this. Is the 2.3 the number of turns in the primary loop to one turn on the pickup loop? What is unpractical about that? Or is this the other way around with 2.3 turns in the pick up to one turn on the antenna primary?

In case you haven't figured it out, this is my weak suit. I didn't have a lot of the core courses in various EE disciplines while focusing on digital. I've picked up a lot over the years in the analog domain and signal processing, but am still rather weak in E&M. On the other hand, I got an 'A' in P-chem! In terms of flunking undergrads, that is the chemistry equivalent of E&M theory in EE.

The spacing seems to be a critical factor for optimizing transfer of energy. One web page talked about spacing the pick up loop, not too far and not too close.

What exactly is a tapped loop? I'm not picturing this.

I'm thinking of maximizing the voltage out of the antenna into a high impedance load. Is that not a good thing to do? With the direct RF sampling by the ADC I need as high an input as I can get.

Yes, I've seen this page. I noticed that he used steel conduit for the shield and another page says to avoid magnetic materials for the shield, although I expect the magnetic shielding of thin wall conduit is minimal.

Really? Clipping is a concern? These antennas are typically very highly peaked at the frequency of interest and I don't expect much interference from strong sources like AM radio stations. Would the clipping just be from noise? My understanding is that here, on the east coast, it is hard to receive WWVB but then that is likely with ferrite antennas. Will a large loop, say 3 foot diameter, pick up a significantly larger signal?

Is the bandwidth that wide? The signal is AM and BPSK modulated at 1 Hz rate with minimum modulation periods of 0.2 and 0.1 seconds respectively. I'm surprised the BW is that wide. I understand that the sharp edge of the modulation requires some bandwidth beyond the bit rate. But a document I found on a government page says the antennas only have bandwidths around 260-310 Hz. But they also say the "system bandwidth" is 5 Hz based on the AM pulse width minimum of 200 ms. I'm not sure this is a good way to figure it.

I would be doing simulations on the digital design, but I found my FPGA software license is out of date. Good thing I didn't get pulled over! :^) But I'll have to wait until tomorrow to get a new license so I can work on that.

So many pages, so little time. I realize that the issues of coupling
are *solved* by using the loop coupling just like the ferrite core
coupling. Opps.

A fair number of LF loop antenna I have found don't bother with this,
but many do.

What will be the impact of not having an actual ground connection
anywhere? Will it be important for the shield to be grounded to a
"proper" ground to be effective? There will be no power line connection
for this device.

Thanks for the suggestions. I have looked at dozens of pages so far.
Many of them are very good, but they only talk about what they did and
don't actually teach so much.

I have a 75 meter loop. I feed it with 600 ohm open wire ladder line. I have experimented with coax and window line.

The 600 ohm ladder line is extremely low loss. This makes up for the nasty mismatch on 75 meters. This scheme got me an antenna that works on 10, 15, and 20 with no tuner. The VSWR is less than 1.6:1 on the worst spot on these bands.

I use this antenna mostly on 75 meters and it works very very well. For some reason I cannot say, the side null of noise from town increased and I got less noise on all bands switching from 450 ohm window line to open wire ladder line. I cannot explain why this happened. It is very nice to see a S0 noise reading on 20, 15, and 10. My 75 meter noise is still between S2 and S3. However, that is quite a step up from what I had originally.

I think the good match on the high bands is because the loop feed point gets higher in impedance at the higher frequencies.

I checked my worst case losses with a calculator on the web. It is found here http://www.kc9aop.net/HAM/antenna_facts.htm#trans_line_loss_calc

Mine calculated out to be about 1/2 db at 75 meters.

I do not ever recall seeing it, but maybe two 'ugly baluns" could be used.
One with say 10 turns (or what ever) and then a few feet away another with
20 turns. One would be good for say 3 to 15 mhz and the other good for 15
to 30 mhz.

However by the time you use this much coax, the bead type choke may be
cheaper.

An interesting thought. I have not read anything that discussed it
before.
Perhaps both the W2DX choke and the ugly balun?

Or may be one is really enough?

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

Hi

Does the Shakespear or standard marine antenna base that is 1" 14tpi fit anything else?

What about 1" national fine thread hex bolt? Or 3/4" npt plumbing type thread? Anyone have any luck using something else without ruining the threads? I cannot use one of their oem swivel base things for the application I thinking of doing.

thnx for any advice,

73s

Rick-

Jeff and others have probably answered your questions with regard to
antenna design. I was wondering what your WWVB receiver was to be used
for?

I considered such a receiver, as well as amplifying WWV at other
frequencies. My goal was to derive an accurate frequency to be used for
calibration of counter timebases.

What I settled on was a Rubidium Controlled Oscillator. I found an
Efratom (Ball) unit on E-Bay, that generates an accurate 10 MHz. I had
to build a 24 Volt power supply for it. It is probably accurate within
a few parts per billion, and is not affected by propagation or
interference.

Yes, some farm impliments that I blundered across in the 1970's.
1"-14 UNS (class 2a and 2b) are used only for marine mounts. UNS
means "Unified National Special" which makes it a defacto standard
thread.

>What about 1" national fine thread hex bolt? Or 3/4" npt plumbing type
>thread?

Did you perhaps notice that the 1"-14 UNS thread is a straight thread,
while all the NPT plumbing threads are tapered?

>Anyone have any luck using something else without ruining the
>threads? I cannot use one of their oem swivel base things for the

I'll do everyone a favor and not describe some of the antenna mounting
abortions that I've seen in the Moss Landing and SCZ harbors, and at a
former employer in the marine biz. Let's just say that it can be made
to fit a variety of non-standard mounts, in a wide variety of ways,
most of really disgusting.

>thnx for any advice,

So, what are you trying to accomplish?

I wasn't sure if the threads were straight as the bolt or tapered as npt (national pipe taper).

I was trying to avoid buying the actual proper thread base (OEM), thought a pipe nipple would work but it didn't, thought a bolt would work but it didn't.

So was wondering if the threads were chewed and that was the reason it wasn't working. I don't have that size tap anyway. Mabey a pipe tap but not a 1" national fine thread straight tap.

Wanted to make a base but now see they are only 20 bucks on fleabay

What would be the best antenna for 2m one could fit up within the 8ft fiberglass shell? That simple cutting of the coax can't be the best can it? This new fiberglass whip I just got is one of the good old ones, very solid and not flaky or nothing like the new shakespear ones they are producing. My cover breaks those too easy.

1"-15 UNS are straight threads. If it's expected to be under
pressure, it's tapered. If there's no pressure involved, it's usually
straight threads (or no threads).

>What would be the best antenna for 2m one could fit up within the 8ft
>fiberglass shell?

What's a "shell"? I'm visualizing a giant fiberglass clam shell. Very
marine looking, but not your typical vessel. Can you be a bit more
specific?

Does 2m mean 144-148MHz ham radio, or a 6ft marine fiberglass antenna?

>That simple cutting of the coax can't be the best can it?

I don't understand. That "best" at doing what?

>This new fiberglass whip I just got is one of the good old ones, very solid
>and not flaky or nothing like the new shakespear ones they are producing. My
>cover breaks those too easy.

First a "shell", than an ambiguous use of 2meters, followed by a vague
"best", and now a "cover". Perhaps you've had an overdose of election
year rhetoric and are trying to emulate the politicians by being

vague. Hopefully, it's not contageous. Some clarification would be helpful.

If you look inside the older (1970') 3ft and 6ft fiberglass whips, you'll get an interesting surprise. Most of the antenna is sticky back copper tape, about 1/4" wide, and glued to the inside of the fiberglass taper. The fatter antennas are usually better built out of copper plated welding rod. The best are stainless rod. The problem is you can't really tell unless you tear it apart.

How to mount a 2.4GHz omni on a 1"-14 marine antenna mount:

Hi Fred,

I am building the antenna as part of a radio controlled clock whose purpose is to construct it to use as little power as possible. This will be powered from scavenged sources such as thermal differences, pressure variations, vibration, light, etc. So the receiver will be done in a very low power FPGA using minimal circuitry and as little analog circuitry as possible.

I may create a PLL to track the phase of the signal. This would use a tunable crystal oscillator which would be "conditioned" against the WWVB signal over long periods of time.

I'm not specifically looking for a reference source, but this would be capable of providing one.

Rick

The thread is Straight Cut as opposed to NPT, which is Tapered...
HOWEVER,

I have cut 3/4" NPT Threads, using my Pipe Threader, that will work on
Marine Antennas. The trick is to have an Adjustable Die, and cut the
threads just a tad bit deeper than normal 3/4" NPT. It works well, as
long as your Pipe has enough wall thickness, to take the deeper
threading. I have used in in Alaska for years, and had no issues with
the antennas or mounts.

You really stuck your foot into this one Bruce, now you are going to be stuck answering stupid questions for the next couple of weeks.

The Fiberglass Shell as the OP called it is called a Radome.

http://en.wikipedia.org/wiki/Radome

The problem the OP has - besides being cheap and wanting something for nothing is the fact that he does not understand what is inside of the radome.

If you disassemble and Antron A99 or a Diamond X 500 - once inside, you will find a piece of copper wire or steel wire or stainless steel wire that is usually copper plated.
Between each section - spaced for certain wavelengths is capacitors of unknown origin which makes the antenna into segments - some for 2 meters and some for 70 CM.
This is what gives it its gain.
These are purpose built antenna's for those frequencies..

You cannot take a Marine antenna - that uses a different frequency and use it on amateur frequencies - due to the fact that there is no way to get internally inside of the antenna and change the lengths of the segments of the wires inside of the antenna.

Unfortunately - there is not a lot of educated Elmers out there that are willing to help a newbe - just due to the fact that most of the people who are left in Amateur Radio came from the CB radio and they were not knowledgeable - like the ones who came before them.

Most of them never built anything in their life and are just appliance operators.

I believe I had this conversation with this person or another person like this person previously.. My advice was that if the threads are of a ******* Origin and you are not willing to repair them or buy the mount to throw away the antenna..

They do not make a tap and die or make one that is economically feasable to repair a $10.00 antenna.. When you get into non standard threads - if you can find a tap and die - they tend to be quite pricey..

We are talking $60 - $100 each...

You would have to fix a whole bunch of antenna's just to break even, and it wouldn't be economical to buy it to fix one antenna.
You could buy a Diamond X 510 for about $150.00 and it would be already designed for the frequencys you desire to operate on.

Hmm...$780? I don't think so, LOL.

"BDWS-65n 4 - 54 Mhz Folded Dipole, Stainless Steel, 65 Ft, N connector,
1 KW"

How can they ask $780 for this antenna? Am I missing something? I
can't imagine this would outperform my loop, especially on the low
bands.

Thanks for the recommendation, though.

That sorta works because 3/4" NPT is also 14 TPI (threads per inch).
Also, pipe is measured by the inside diameter, while nut and bolt type
hardware, which includes 1"-14 antennas, is measured by the outside
diameter. The result is that 3/4" NPT and 1"-14 UNS can be made to
fit.

I've seen the results of this method of antenna mounting. If the
antenna base is heavy and strong, it will work. If it's cheap pot
metal, the tapered pipe thread will crack the base when tightened. If
the 3/4" NPT is a little on the large side, it will be supported by
only by one or two threads. Hit the antenna with anything, and the
base will peel out of the mount.

The practice of using 3/4" NPT mounting is even more of a problem with
GPS antennas, which are usually mounted on some manner of pipe. In
order to avoid having two thread standards, Trimble and other have
standardized on an odd compromise threading that works with both 1"-14
and 3/4" NPT. For example:
<http://trl.trimble.com/docushare/dsweb/Get/Document-8420/Bullet-III_DS.pdf>
The socket accepts either a 1"-14 straight thread (typical
marine antenna mount) or a 3/4" pipe thread.
However, to the best of my knowledge, such a thread is not used in
marine antennas.

So much for diplomacy.

>If you disassemble and Antron A99 or a Diamond X 500 -

$270 list for the Diamond X-510.
<http://www.rfparts.com/diamond/x510series.html>
The problem with such large antennas for VHF use on a vessel is that
they have too much gain. The vertical radiation angle is fairly
narrow. My guess(tm) is about 5 degrees at 450MHz and 10 degrees at
146MHz. As the vessels pitches and rolls, much of the RF is directed
into the water or into the sky, with very little going towards the
horizon. Unless one has a gyro stabilized platform, a lower gain
antenna might be more useful.

>once inside, you
>will find a piece of copper wire or steel wire or stainless steel wire
>that is usually copper plated.

Inside a Diamond X50 dual band ham antenna.
<http://802.11junk.com/jeffl/antennas/Misc/x50.jpg>
Sorry about the lousy photo. It's badly stitched together from four
seperate photos. If you're wondering what happened, the former owner
leaned the antenna against the garage wall, and then backed his car
into it.

>Between each section - spaced for certain wavelengths is capacitors of
>unknown origin which makes the antenna into segments - some for 2 meters
>and some for 70 CM.
>This is what gives it its gain.

That's the brass sleeve section in the middle. The gain is provided
mostly by properly phasing the radiating sections so that the signals
add.

>These are purpose built antenna's for those frequencies..

I should hope so. I would be seriously worried if they were built
without any purpose in mind. Perhaps for decorations as it's well
known that the uglier the antenna, the better it works.

>You cannot take a Marine antenna - that uses a different frequency and
>use it on amateur frequencies - due to the fact that there is no way to

>get internally inside of the antenna and change the lengths of the
>segments of the wires inside of the antenna.

You'll be amazed at how little is actually inside a marine antenna. I don't have any photos handy. Most are copper tape glued to the inside of the tube, errr... radome. The rest are variations on coaxial (sleeve) antennas. However, for entertainment, I glued some magnetic recording tape (ferrite) along the copper tape and was able to lower the resonant frequency from about 156MHz to about 149MHz. That's not enough for ham use, but does show that it can be done.

>Most of them never built anything in their life and are just appliance
>operators.

Again the diplomacy problem...

>They do not make a tap and die or make one that is economically feasable

Thanks Channel Jumper

I don't think my questions are "stupid".

First off, you didn't answer my last question, you sounded pretty intelligent with your swaying me thoroughly into oblivia, completely around my question.

It is obvious you understood the question, probably knew the answer, but didn't answer my question. Remember Channel Jumper, radio wave propagation and antenna theory was not what I majored in at the schools. I did graduate you know. I mean a accredited university gave me my masters. Do you have any accredation at all? Well then you cannot call me "stupid". I am willing to bet my career required a lot more years of study than yours. And continuous learning and upgrading. Yes, you are very knowledgable in regards to antenna work, however follow me for a day and I am sure you would be asking a lot of "stupid" questions.

I will ignore negative comments from you. But you still didn't answer my last question, you brilliantly jigged right around it. Wouldn't touch it. I figured you didn't know the answer yet it was on topic, about the coils of the dipole, but you went right around it twice. Why not just say you don't know the specific answer? Instead of trying to thrill me with your wealth of knowledge on antenna design and engineering, I just wanted to know lengths and widths. But you read a page from your first year electrical theory course to me that went right around my question.

Channel Jumper may be a real smart Book Learned Radio Guru..... but he
doesn't know squat about Marine Antennas, and how well they work, on the
2 Meter Ham Band. Having spend a career in Marine Electronics on the
West Coast, and Alaska, I can state with 100% certainty, that a Marine
VHF Antenna, will certainly work, on 2 Meters, with very little
degradation, and about 90% of Radio Horizon to Radio Horizon coverage,
when the TX Power RF Output level is above 25 Watts. I have considerable
experience with designing, and installing, VHF Paths for Control & Comms
for the Fishing Industry, and Marine Coast Stations, all over the West
Coast and Alaska. I used 2 Meters to pioneer those paths, with Marine &
Business Antennas, before the appropriate Licenses were issued, for use
on the Marine and Business Frequencies. Never had a significant change
in Path Fade margins, or Path Loss Data, between the Pioneering
Frequencies, and the Final Operational Frequencies. Just Say'en....

Put the antenna on a terminated wattmeter and see how little power you
actually couple in this manner. Incidentally, this is also why
through the glass antennas are lossy. Such coupling arrangements were
popular with cell phones that lacked a proper external antenna
connector. They function acceptably only in strong signal areas, but
still are rather lossy. I had one in the car kit for my Motorola
MicroTac Flip-Phone.

I can't tell from your miniature photo what model commerical VHF
handheld you're using. If it's Motorola, there are a variety of
bizarre and often complicated antenna adapters for literally all their
handhelds. Same with Kenwood and other handhelds. I have a fair size
collection. For example:
<http://store03.prostores.com/servlet/henryradio/the-181/BNC-Antenna-Adapter-/Detail>
<http://store03.prostores.com/servlet/henryradio/the-122/BNC-Antenna-Adapter-for/Detail>
<http://store03.prostores.com/servlet/henryradio/the-251/BNC-Antenna-Adapter-/Detail>
<http://store03.prostores.com/servlet/henryradio/the-90/BNC-Antenna-Adapter-/Detail>
etc. One of these adapters is required to connect the radio to a
service monitor for bench testing.

Hi OM Jeff,

Thank you very much for all the information.

The rig in the photo is a Kenwood with a BNC!

The problem was with a Motorola HT.

I would be interested to know how they get 2dBi gain from a monopole
with a ground plane, ground radials, or 1/4 wave sleeve for
decoupling. Bandwidth, VSWR plot, install instructions, power
handling limit, etc seem to be lacking.

I've done measurements and reverse engineering on several commercial
through the glass antennas. For loss testing, I removed the antenna
rod, found a suitable grounding point inside the base, attached a coax
pigtail, and connected it to a spectrum analyzer for sweep testing in
the cellular phone and PCS bands. The best I saw from about 4
different devices was about 4dB loss. The remaining RF was either
dissipated in the glass, reflected as VSWR, or radiated through the
glass gap.

These daze, automobile glass is coated with one of a variety of
coatings designed to prevent the vehicle from becoming an oven. TiN
(titanium nitride) seems to be the most popular (not sure). The
problem is that with a sheet resistance of about 35 ohms per square,
TiN does as good a job of blocking RF as it does blocking IR. To
allow cell phones to be used inside the vehicle, the side windows are
usually not coated. Although I've never seen it, applying RF to a
through the glass antenna on a TiN coated window might cause the TiN
coating to "blister".
<http://802.11junk.com/jeffl/crud/Low-E-titanium-nitide-glass.pdf>

I just found several through the glass antennas that I previously
disected. Photos later...

eBay and Amazon have an assortment of Motorola antenna adapters.

I should mention there are adapter combinations that seems to be a
problem. When the handheld radio has an SMA connector, using an SMA
to BNC or SMA to UHF adapter is a bad idea. Like this:
<http://www.ebay.com/itm/220576696299>
These adapters are too weak to survive when attached to a thick heavy
coax cable. Move the handheld, and presumably the coax will take the
bending. However, if the coax is stiff, like RG-6/u, LMR-400, RG-8/u
etc, the adapter will take some of the bending force. I've broken at
least two this way. What I do now is make a short pigtail, with an
SMA at one end, and a BNC at the other. The pigtail is made from
RG-58/u or LMR-240, which is sufficiently flexible to survive.

The one piece SMA to BNC adapters are better:
<http://www.ebay.com/itm/250930122068>
but don't quite fit every model radio with an SMA connector. They all
need a rubber o-ring between the base and the case of the radio.
Without this o-ring, it's no better than the SMA to BNC adapter, and
the radio SMA connector is likely to break (or the plastic case).

You can also reduce some of the forces involved with one or two right
angle connectors, forming a swivel joint.

In a strong signal area, you probably won't see much difference.
Through the glass antennas work much better than a rubber ducky
antenna on a handheld. However, there's no comparison with a 5/8 wave
antenna with the vehicle roof as a ground plane. What's a "normal"
antenna and how did you do your testing?

>The type of glass can have a considerable effect on performance though,
>some of the 'tints' in windscreens do seem to introduce noticeable loss.

<http://www.pulseelectronics.com/products/antennas/larsen_antenna_products/technical_refer
ence/faqs#On_Glass_Antennas>
You can also recognize passivated (coated) glass that won't work using
a "stud finder". Metalized glass coatings will drive the stud finder
nuts. Glass without any metal inside will remain unchanged. There
are various suggestions on the web to use a capacitance meter. I
never could get that to work.

Good post.

All I can say is that the reason why a handheld works as good as it does
is because there is no feed line loss between the handheld and the
rubber duckie antenna.

When you add loss - you loose.

I have a 2 meters Radio Jap HTX 202 - ancient, that works with the
handheld antenna, but has a hard time doing it's job with a good Larsen
NMO 2/70 antenna on the roof.

Trying to put signal through glass is a lot like trying to supply a
cities drinking water through a common sippie straw.
YOu can get a little water through it, but not enough to make it worth
your while.

Kinda depends on the coax cable type and length. 25ft of RG58a/u or
RG174/u seems to be the standard. At 145MHz, that's 1.3dB and 2.6dB
loss respectively. With an alleged 2dBi gain antenna, the RG58a/u
coax loss is less than the antenna gain, resulting in net improvement.
With the RG174/u, there's a 0.6dB net loss.

>I have a 2 meters Radio Jap HTX 202 - ancient, that works with the
>handheld antenna, but has a hard time doing it's job with a good Larsen
>NMO 2/70 antenna on the roof.

The Radio Shack HTX202 is not my idea of a great radio. Favorite
problem is that it gets stuck in transmit with low battery voltages. I
probably have the same Larsen dual band antenna on my vehicle.
However, I'm using a Motorola Maxtrac on 2 meters, which works just
fine. The usual problem with HT's is that they can hear much better
than they can transmit. Vehicular power amps help, but the best
answer is a real mobile radio with decent power output.

>Trying to put signal through glass is a lot like trying to supply a
>cities drinking water through a common sippie straw.
>YOu can get a little water through it, but not enough to make it worth
>your while.

Roll down the windows?

The loss depends on the glass. I had no problems with my previous
vehicle, an Isuzu Trooper. However, my current 2002 Subaru Forester
has coated glass everywhere, and is therefore problematic using a cell
phone with the windows closed. I've done quite a bit of (paid and
unpaid) tinkering with attenuation of wi-fi (2.4/5.6GHz) signals
through assorted building materials, including glass. Unfortunately,
I've done little tinkering with automobile glass. Attenuation through
glass types used in buildings varies enormously. Clear window pane is
almost totally transparent to RF. Titanium nitride coated double pane
glass is about -20dB. Some others:
<http://wireless.navas.us/index.php?title=Wi-Fi#Attenuation>
The attenuation at VHF through coated single pane automotive glass
will be much less than at 2.4GHz. I don't have a clue as to the

number, by my guess(tm) is about -3dB for coated auto glass.

I can't do a simulation without dimentia, err... dimensions and
details on the transformer characteristics. Much as I like playing
with 4NEC2, measurements tend to be less forgiving.

>On the VHF versions that I

The photo did not look like a 1/2 wave monopole, which does not
require a ground plane.
<http://www.panorama-antennas.com/index.php?route=product/product&path=27_69_71&product_id
=144>
It looks more like a 1/4 wave on 2 meters.

>Of course in a 50 ohm system the C value produced by the coupling unit

Yep. 1/2 wave monopole has a rather high input impedance and doesn't
require a ground plane.

>That tends not to be the case in the UK with most manufactures, although
>there is tinting it is not of the heat reflective variety.

If it's not for heat reflection, is there another reason to have
tinted glass on all the vehicle windows?

Most of those require tuning. The glass thickness and composition
also affects the tuning.

>This is of course a bit different to a cellphone system that requires a

Visualize the automobile glass being made like green house glass.
Instant oven.

There's a simple test to see if the glass will pass IR. Find a
digital camera and a TV IR remote control. You can see the IR on the
LCD screen on most digital cameras. Put the camera inside the car,
and the remote on the outside. If you can see the IR LED's, the glass
is passing IR. If not, it's reflecting or absorbing IR.

However, that's near IR (0.700 ï¿½m - 1.4 ï¿½m) which is not heat. For
long wave IR (8 - 15 ï¿½m), use an optical IR thermometer gun and a heat
source. If it detects the heat source through the glass, it's passing
long wave IR. If not, it's being reflected.

A vertical antenna's gain is UNITY - 1

The only gain you can express is gain over Isotropic which would be
about 2.8 DBI - which doesn't mean anything.

To have gain over a dipole antenna, it would have to be larger and more
efficient then a dipole antenna - half wavelength in size..

>A vertical antenna's gain is UNITY - 1

Wrong. The type and length of a vertical antenna will produce
different gains. Just look at any antenna manufacturers catalog.
Simply mounting an antenna vertically does not magically give a unity
gain.

>The only gain you can express is gain over Isotropic which would be
>about 2.8 DBI - which doesn't mean anything.

Wrong. The gain of a dipole antenna is generally considered to be
2.15dBi. It means that:
dBd = dBi + 2.15dB

>To have gain over a dipole antenna, it would have to be larger and more
>efficient then a dipole antenna - half wavelength in size..

Wrong. It is possible to produce an antenna that is "larger" than a
dipole, but has less gain. In general, bigger antennas do tend to
have more gain, but there are some exceptions. A 1/2 wave dipole has
a nice neat pattern that looks like a torus (donut) around the wire.
Add additional 1/2 wave sections with the proper phase and the donut
gets flattened, yielding more gain. However, it can also work the
other way. Add phasing sections that tend to radiate along the wire
axis, and you'll fill in some of donut hole. That will reduce the
diameter of the donut, and thus reduce the gain.

This is mine:
This is only a test,
I'm really trying my best.
If this doesn't work,
I'll feel like a jerk,
and fix whatever I messed.

Required antenna related content:

Lesson learned this morning. Do not run RG-58a/u across a doorway at
waist height as it can't be seen in the dark. I did a shoulder roll
down a few stairs and landed on a pile of wet rubbish. Fortunately,
the badly assembled BNC connector attached to my service monitor fell
apart, preventing the service monitor from hitting the floor.

Incidentally, what I was doing was running a spectograph of FM
broadcast audio to see if the 19KHz pilot tone could be easily
extracted (to settle an arguement in sci.electronics.design).
<http://802.11junk.com/jeffl/crud/FM-19Khz.jpg>
May I suggest you download and play with the software. There's quite
a bit of useful stuff in there, much of which is ham radio specific.
For antennas, there's a direction finding display, which I have yet to
try.
<http://www.qsl.net/dl4yhf/spectra1.html>
Incidentally, contrary to the web page, it works fine under Vista
(32bit), which I was using last night.

Better yet, post in a 'test' group.

2679. Connecting built in antenna tuner to ladder line.

Newsgroup: rec.radio.amateur.antenna
Date: 2012-11-25 22:08:00 UTC
From: Tom W3TDH <hornetd@gmail.com>
Message-ID: <a0250d8b-9983-440c-bb40-7b5ce1d68502@p17g2000vbn.googlegroups.com>
Source record: 546

Thanks to the generosity of a fellow radio club member I now have the use of a Yaesu FT-1000 (no Suffix). Since it has a built in antenna tuner, that I'm hoping to use, I need to ask what the best way is to couple the window line that feeds my folded dipole antenna into a short; say twenty feet; coaxial feeder from the radio. I used an Icom AH4 antenna coupler with my FT-857D on this antenna with very good results. I would guess that I need a balun but which type is a mystery to me.

So is a balun a good solution to this challenge or should I resort to the two pieces of coax in parallel that I have read of elsewhere? When you use the two parallel coax leads do you ground and/or bond the two shields at the transceiver end? Further since the FT-1000 does not have obvious balanced feed line terminals would I connect a balanced feed line to the ground terminal and the the center pin of the SO239 connector by using say a banana plug.

Since I really am asking questions I hope there is already a consensus answer as I would not be able to sort out the various sides of any debate. Thank you in advance to all who choose to tackle this question.

Tom Horne W3TDH

> Thank you in advance to all who choose to tackle this question.

Assuming your folded dipole is a resonant antenna with a feedpoint impedance around 300 ohms, with a 1:1 balun, the 50 ohm SWR would be 300/50=6:1 and that is probably outside the range of most built-in autotuners. Assuming a 300 ohm feedpoint impedance, a 4:1 balun would bring the 50 ohm SWR down to 75/50=1.5:1. 4:1 baluns are inexpensive so I suggest a 4:1 balun as a first try. You might get by with the less expensive 4:1 voltage balun but I recommend a 4:1 (dual-toroid) current balun.

Well, back in the mid-1960s, when I was building an EICO FM stereo receiver
from a kit, there was circuitry dedicated to recovering the 19 KHz pilot tone,
with a nice explanation in the assembly manual about how this new-fangled "FM
stereo" stuff worked. Yes, indeed, it was trivially recoverable.

I built an Eico MX99 stereo decoder in the same time period.
<https://www.google.com/search?q=eico+stereo+decoder&tbm=isch>
I think I was 15 years old at the time. It worked, but not very well,
because I managed to crack all the tuning slugs by using an Allen
wrench instead of a plastic tuning tool. Some wax in the coil form
was sufficient to hold the pieces of the tuning slugs in place.
However, with tubes, the box tended to get hot, causing the wax to
melt, which precipitated another retuning exercise. I eventually
found a combination of ferrite pieces, metal scraps, and wax that
would keep it tuned.

The discussion in sci.electronics.design on the topic was rather
frustrating. The OP didn't answer my questions, kept changing the
design target, was as vague as possible, and kept throwing in highly
creative mathematical and software solutions to a non-problem. This
was reinforced by a well known DSP expert, who claimed that the 19Khz
signal could not be recovered. Welcome to usenet at its worst.

Yesterday, I did a careful inspection of my rooftop coax cable maze
and found numerous pieces of outer jacket missing thanks to the local
critters. From a cursory inspection, it appears that something had
taste-tested my coax cables at fairly consistent 6" intervals. I have
PVC conduit in the walls. I guess I now need it on the roof. Oddly,
my radios still work fairly well with big pieces of the coax braid
missing. Might as well junk the antennas and just use the chewed coax
cable for an antenna.

I've been doing more work on the low frequency tuned loop antenna and have two problems. One is that I can't find any info on how effective the antenna will be in relation to the design parameters. That would be the diameter of the loop, the number of turns and the spacing of the turns. From the formulas I find for inductance, I would guess that the spacing of the turns will want to be as small as possible, but I'm not sure the factors that optimize self inductance are the same as what will optimize antenna effectiveness.

What equations determine the signal strength from a low frequency tuned loop antenna?

The other problem is finding an accurate formula for the inductance of this design. I've found a number of equations for coil inductance, but most are for coils with length longer than diameter. One I found doesn't say what it's limitations are and doesn't agree with the others. In fact, I can't find two formulas that approximate each other over the range of interest which is 1 to 20 turns or d/l from 4 on up.

I've consulted the Radiotron Designer's Guide, Nagaoka's and Lundin's papers on inductance of coils as well as a number of web pages. I'm getting tired of looking... Is there a reasonable formula for calculating the inductance of a short coil that works for a number of turns from 1 to 20?

Sorry about that. Thunderbird is a bit odd, for me at least. You have to forward a message to send it to a group, replay just send a mail to the person you answer. I'll try to keep that i mind in the future.

I'll done my homework now. The whole signal, with pilot and all is generated and then modulated on the carrier. Your proof will be solid.

A 4:1 current balun, A.K.A as a 4:1 Guanella balun, does a god job.
Constructions using just 2 coax-lines will have problems to cover all HF
bands. To little inductance at the lower bands and you have to keep the
length less than a quater wave on the higher ones.

Google on 4:1 guanella balun and you will find a lot of sites that shows
how to make one. Just be aware of those who just uses one core, these
designs will degrade the performance (common mode) of the balun.

Just to give an update...

I got a response from Randy Yates in the comp.dsp group who gave me a formula for the loop antenna signal strength which I'm including below for reference. He said it came from the ARRL Handbook.

> They dedicate an entire chapter (5) to loop antennas. Equation one
> is the voltage at the loop terminals:
>
> V = (2 * pi * A * N * E * cos(theta)) / lambda,
>
> where
>
> A = area of loop, in m^2
> N = number of turns in loop
> E = RF field strength in V/m
> theta = angle between plane of the loop and the signal source
> lambda = wavelength in meters.
>
> Note that I know nothing about antennas - just acting as a scribe...
This is the expression for an untuned antenna. Shortly after this, they provide the equation for a tuned antenna, which is identical except for the addition of a Q in the numerator.
-- Randy Yates Digital Signal Labs http://www.digitalsignallabs.com

I did the calculations and at 100 uV/m with 50 foot of coax in a two turn loop I get a bit over 1 uV, not so good. I'm going to see what I can find about the signal level from ferrite cores. I had the impression they would be lower, but I seem to recall better numbers than this in the ones I've seen before.

The key is to only use resonant antenna's....

IN the early days of amateur radio, there was no coaxial cable - hence
we did not care much what the SWR was.
We used a Johnson Matchbox with a couple of coils and life was good.

Then after world war two - coax became available and people bought it
because it was cheap and it worked.
The problem was - how to match it.

The regular MFJ 949 series tuner was usually employed - although most
people do not understand that it cannot make a non resonant antenna
resonant.
The bottom line is - even if they claim they can work everything they
can hear - what are they hearing?
Not everything that a person with a resonant antenna hears....

Having a good transceiver to use, and not wanting to damage it - you
want to buy the best possible antenna's for the money...

One point I always make with new hams and inexperienced hams is to do
lot's of research and to listen before transmitting...
Listen, listen, and listen some more......

There are lot's of nets with real hams up on 80 and 160 meters - if you
can find them that knows a little about this stuff...

Some good web pages to look at are K3CC, K0BG, KC9AOP

Apparently, some people don't understand the maximum power transfer theorem. An antenna tuner establishes a Z0-match to 50 ohms, commonly called "making the transmitter happy". If the antenna system is a low-loss system, the effect of that Z0-match in the shack is a near-conjugate match at the antenna feedpoint which guarantees maximum transfer of available power to the antenna. It doesn't matter if the antenna by itself is resonant or not. Conjugately matched *systems* ARE resonant.

Let's assume we have a non-resonant antenna with a feedpoint impedance of 100+j200 ohms. If we feed the antenna with open-wire line and adjust the antenna tuner in the shack such that the impedance looking back down the transmission line towards the source is 100-j200 ohms, the reactance is neutralized, i.e. *system resonance* is established with an apparent 100 ohm source and 100 ohm load thus ensuring maximum transfer of available power.

The well-respected Extended Double Zepp is an example of a non-resonant antenna that will outperform a resonant 1/2WL center-fed dipole in the dipole's favored direction. Note: with the feedline disconnected, a 1/2WL center-fed dipole is non-resonant. Connecting the coaxial feedline resonates the antenna system just as connecting a properly tuned open-wire feeder resonates the antenna system.

Consider a 50 ohm 1/2WL resonant center-fed dipole fed with 1/2WL of open-wire line. The SWR on the feedline is 12:1, i.e. a severe impedance mismatch exists at the antenna feedpoint. Yet, the transmitter sees 50 ohms and this mismatched system is more efficient than most coax-fed antenna systems.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

Hi OM Mac,

I faced the same problem with crows pecking away at the coax lying flat
on the roof of the shack.

The problem was solved by raising the coax run from the shack wall to
the roof-top mast.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:
```

I am looking for tutorial information on cutting coaxial cables to various electrical phase lengths. I have directional couplers for the VHF and UHF bands I am concerned with and also access to a vector voltmeter. I am proficent in terminating cables with connectors but realizing there is more than one way to skin a cat and would also welcome input on assembling the cables.I am not looking to open a discussion on this but discussion would be welcome. Instead I am desiring direction to a website that has a tutorial on the subject.

TIA
Jimmie

I also used to use a slotted line for generating a phase reference at
RF frequencies. It's then just a matter of comparing your cut coax
phase shift with that from the slotted line. A telescoping coax cable
section might also work, but I've never tried it. Accuracy was kinda
low, but good enough for what I was doing.

Do the cables always have an SWR of 1:1, i.e. are they always flat? If not, the cable will also transform impedances which adds another dimension to the complexity.

Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.2 2011/11/02 04:08:53
Posting-Frequency: posted twice monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

You are over thinking the problem at hand.

The purpose of the phasing cables is to put the two antenn'a in phase
with each other.
You don't tune the antenna with the coax - you tune it with the antenna
matching unit.
Once the antenna is tuned - the length of the coax is the matching unit.

>with each other.

You may not want the two antennas to be in phase. It would be more
generally correct to say that a phasing cable puts the phase of one
antenna to what it needs to be with respect to another.

>You don't tune the antenna with the coax - you tune it with the antenna
>matching unit.

If the feed impedance of the antenna itself is not the same as the coax,
the length of the coax will affect the tuning of the 'antenna system' -
ie antenna plus feeder - ie what the transmitter sees.

>Once the antenna is tuned - the length of the coax is the matching unit.

Only if 'tuned' equals 'matched' - otherwise the length of the coax will
affect the impedance seen at the transmitter end (or at some
intermediate point, if that is relevant to what you're doing). And, of
course, regardless of matching, the length of the coax will also affect
the phase of the RF reaching the antenna.
>
To answer the question, except for very low frequencies, the
characteristic impedance of coax itself should be 'flat' (having a
constant characteristic impedance at all frequencies). If it is
terminated by its characteristic impedance, it will have no standing
waves on it. Usually, standing waves are considered a 'bad thing', but
if a short length of coax is used to transform one impedance to another,
there are bound to be standing waves on that particular piece of coax.
However, as the length of the transforming coax is typically a
quarterwave, mismatch losses are pretty negligible.

2707. WWCR is Owned by Jewish Homosexuals

Newsgroup: rec.radio.amateur.antenna
Date: 2012-12-18 00:32:41 UTC
From: Michael JONES <edlabounte@gmail.com>
Message-ID: <8487638d-dadf-4644-bfd8-e3b63c880286@n5g2000vbk.googlegroups.com>
Source record: 474
Cross-posted to: alt.slack,rec.radio.shortwave,soc.culture.jewish,soc.culture.israel,rec.radio.amateur.antenna

WWCR, so-called "Worldwide Christian radio", is owned by jewish homosexuals. Don't be deceived by these slime bags. The company that owns WWCR calls itself (for some reason) "F.W. Robberts Broadcasting Co. Inc.". They are located at 2730 Loumor Ave., Metairie, LA, 70001. Their phone number is (504) 831-6941, and Fax (504) 832-4039. The company is owned by Fred P. Westenberger (jew), Chris P. Westenberger (jew), Fritz N. Westenberger (jewish homosexual), and a couple other Westenbergers.

Now just why on earth would a bunch of jewish homosexuals run a supposedly CHRISTIAN radio station? Do you many Christians that run jewish or homosexual radio stations?

Here's a NY Times article about the very nice house that Fritz N. Westenberger and his "partner" Patrick live in. They often entertain many of their jewish homosexual "friends" at this house:

http://www.nytimes.com/2011/07/29/realestate/house-tour-olive-ny.html?_r=0

This very nice home was built with the money that you sent to WWCR to buy the shyster jew products they sell on that station, for example products sold by the Jew named Alex Jones. The jewish homosexuals who run WWCR really promote Alex Jones a lot. I wonder why?

The entire purpose of WWCR is to push Israeli disinformation to cover up the criminal activity of the jewish crime network. That is Alex Jones' sole purpose for existing and being promoted by other jewish homosexual media outlets, such as Disney/ABC, etc.)

DO NOT SPEND ONE PENNY OF MONEY ON THE SHYSTER FREEMASON JEW CRAP PRODUCTS THESE HUCKSTER CRIMINALS ARE PEDDLING.
Understand that the sole reason these jews run a supposedly Christian station is TO DECEIVE YOU, about the crimes being committed by jews, such as the 9-11 attacks, that were the work of Israel, and to GATHER INFORMATION, ADDRESSES AND PHONE NUMBERS OF PEOPLE WHO ARE AWARE OF AND OBJECT TO THE JEWISH CRIME NETWORK.

Spread the word: WWCR is owned by jewish homosexuals. Boycott them, and bankrupt every single shyster that broadcasts on that station, and
let's get jewish homosexual criminal trash OUT OF NORTH AMERICA AND EUROPE, BY ANY MEANS NECESSARY.

You are a Nazi.

As a Nazi, you are, above all else, a craven coward.

You are afraid to compete with others as equals because you know
you can not measure up.

You are afraid of your own inadequacy, so you want to murder your
betters.

You are afraid of the truth, so you want to murder those who would
tell it.

You are afraid of history, so you want to murder the past, to wipe
out the knowledge of the degeneracy, cowardice and failure of
National
Socialism.

Finally, you are afraid of the power of educated, informed adults.
Freedom of choice terrifies you... which is why you choose minor
children as sexual partners. You can not interact with competent
adults in a consensually sexual
way. You need to be able to impose yourself on a helpless victim, be
it a prepubescent
boy, or a patient in a mental hospital.

That is what you are, a Nazi, and there is nothing polite or
honest about it.

Michael

There is a real neat thing about radio, they usually include some type of large tuner knob on the front and if you do not like what you are listening to - you can turn the knob somewhere else, or you can turn it off if you please.

No one is forcing you to listen to what they have to say...

If someone, out of the goodness of their heart, goes to all the trouble of putting up a radio station and paying people to work there and paying to keep the transmitter on the air, then what business is it of yours who owns it!

Radio - the last time I checked is FREE!
You do not have to pay anyone for the right to listen to it, nor do you have to pay to watch television - as does the people in England and other socialist countries....

Take your hate message and go somewhere else!

Nazism, like all forms of "socialism", is a creation of satanic jews
like you and your grandparents. ALL "neo-nazi" groups are run by jews,
for example, this guy:

http://en.wikipedia.org/wiki/Frank_Collin

Mike [Nefesh here :-)] There is nothing wrong with one race or culture of people thinking they are superior to all others. That is only natural. Where the Nazi's made their biggest mistake was persecuting the Jews to the point of exterminating us and seeking to destroy us completely from the face of the earth. That the Nazi's would have embraced the Jews and sought to ally with the Jewish people and not made war on their neighbors then they could have addressed the homosexuals by giving them a choice of leaving Germany or be put to

death and the Nazis might have done better but they were wicked and Hitler played on that wickedness to exploit the beaten spirit of the Germans after WWI. In the end HaShem destroyed them through the allies.

Many of the Nazi nithings, like Ernst Roehm, were homosexual.

Michael

Who is HaShem? Is that like Dr. Evil or Skeletor? Does G.I. Joe make
an appearance in your tale also?

I think we both agree that much of the strife in the modern world is due to F. Delano Roosevelt's demands for unconditional surrender of Axis powers during WWII. His desire for satisfaction prolonged the war unnecessarily and fueled German propaganda, in direct opposition to his stated goals. How can your archives serve to rectify this shortcoming that each of us faces in the new world?

My opponents call me an antisemite.

I do not hate you anymore than I hate the heathen. In fact, I look to you with greater respect than that because you are halfway to life. You only need to accept the gospel and then you will be fulfilled.

I prefer to think of myself as a semite-teaser. One who taunts you because you do not keep up, like the taunting of Private Gomer Pyle in Full Metal Jacket. I keep communication civil and do not use hateful slurs.

Of course some of you will hate me more for this. For I cannot be classified easily as one of your enemies and this makes you grunt and grumble because you have your recipe for retaliation of the day, which changes from day to day like pop music.

Look to me as a friend who has your best interests at heart. I will not kick you or beat you, yet I will debate with you until you accept Jesus Christ as your Lord and Savior.
--
Who told you to think?
I don't give you enough
information to think.
You do what you're told, that's what you do.

You are a nithing- homo sapiens by birth, subhuman BY CHOICE. The key word is CHOICE. You were born with the same human nature as the rest of us. Your CHOICES made you a nithing.

Bill explains what nithings are.

http://www.israpundit.com/2008/?p=9446

Define and Dehumanize the Enemy: Jihadists as Nithings or Nidings

by Bill Levinson
It is an ancient principle of magic (which modern people recognize as stories that reflect a society's culture and psychology) that knowledge of a person's real or True Name delivers power over that person. What it really means is that, if you know the person's psychology, you can gain an advantage over him. It is also well known that the side that controls the language of an argument controls the argument. As an example, Hamas terrorists and their enablers refer to Israel's military as an "occupation force" and terrorisitic violence against civilians as "resistance."

We have long sought a single word that strips the enemy of all humanity, and reduces him to something less than an animal that is worthy of nothing less than extermination. As far as we know, the English language contains no such word, although "dreck" (garbage or refuse) comes close. "Homo sapiens by BIRTH, subhuman by CHOICE" describes Islamic supremacists perfectly, but it is a phrase and not a word. We now propose to refer to Islamic supremacists as nithings or nidings: a Scandinavian word that strips its object of all humanity. Webster's dictionary (1913) defines it as "A coward; a dastard; — a term of utmost opprobrium."

We remind readers who object to the dehumanization of Islamic supremacists that those enemies are already attempting to dehumanize Jews, and to a lesser degree Christians, with images that could have come directly from Adolf Hitler. As they have chosen to sow the dragon's teeth, our position is that they must now reap their rightful harvest: the complete hatred and loathing of all civilized human beings.
nithings

Nithing or niding was more than a common insult, because Scandinavian culture required its subject to fight a duel with the accuser or become an outlaw: totally devoid of rights, honor, and even recognition as a human being. Per the Wikipedia entry,

The actual meaning of the adjective argr or ragr [= Anglo-Saxon earg] was the nature or appearance of effeminacy, especially by obscene acts. Argr was the worst, most derogatory swearword of all known to the Norse language. According to Icelandic law, the accused was expected to kill the accuser at once. …If the accused did not retort by violent attack yielding either the accuser to take his words

back or the accuser’s death, he was hence proven to be a weak and cowardly nithing by not retorting accordingly.

A nithing was devoid of all human rights, and he was considered the enemy of civilized humanity: a perfect depiction of Islamic supremacists. The word therefore strips the enemy of all humanity, and degrades him to the status of a wolf or strangler (per Scandinavian tradition) or a virulent disease like the Black Plague. Black Plague is a deadly and contagious disease whose vector consists of plague-carrying rats, while the Green Plague of militant “Islam” is a deadly and contagious ideology that is spread by bipedal rats: nidings or nithings, non-humans that raise violent hands to all of civilized Humanity.

The immediate consequence of being proven a nithing was outlawing. The outlawed did not have any rights, he was exlex (Latin for “outside of the legal system”), in Anglo-Saxon utlah, Middle Low German uutlagh, Old Norse utlagr. Just as feud yielded enmity among kinships, outlawry yielded enmity of all humanity.[63] …”Yet that is but one aspect of outlawry. The outlaw is not only expelled from the kinship, he is also regarded henceforth as an enemy to mankind.”

The actual definition of a nithing is somewhat more involved and complex, and it gets into sexual perversions and zoomorphical transformations (Loki’s transformation of himself into a mare to have sexual intercourse with a stallion, and thus beget Odin’s horse Sleipner is probably an example), but the following line is pertinent: “The nithing used its malicious seid magic to destroy anything owned and made by man, ultimately the human race and Midgard itself[6], due to its basically unlimited envy, hate, and malice that were nith.”

“Destruction of everything owned and made by Man” (the Palestinians’ destruction of the greenhouses in Gaza comes to mind immediately) and “unlimited envy, hate, and malice” describe militant “Islam” perfectly, and further underscore the application of nithing or niding to describe it. The propensity for mindless destruction also appears in Orson Scott Card’s Alvin Maker series, in which a supernatural enemy is known as the Unmaker: a personification of evil that is the total antithesis of God the Creator.

The Unmaker is the main antagonist in Orson Scott Card’s alternate history/fantasy series The Tales of Alvin Maker. Never directly confronted, it is a supernatural force that breaks apart matter and aims to destroy and consume everything and everyone. …To make something is to oppose the Unmaker, but a point often made is that this is futile. By natural law the Unmaker can tear down faster than any man can build.

This also is an outstanding definition of militant “Islam” or Islamic supremacy: an ideology that seeks to destroy everything into which it comes in contact, and with which no reason, negotiation, or compromise is possible.

In summary, a nithing or niding is the enemy of Civilization, a subhuman (through its behavioral choices, and emphatically NOT due to its racial or ethnic origin) monster with total hatred and malice toward all human industry and arts, and worthy of nothing but extermination like any virulent disease. This is the word we will now apply to Islamic supremacists and their enablers, and we encourage others to do likewise.

Really what terms would Hitler have accepted to end the war?

You are asking me, what would Hitler have accepted besides the worst
possible outcome? Is it really just because of a misunderstanding of
English that the world suffers today?

Have you ever heard the Grateful Dead lyric, "A friend of the devil is a
friend of mine?" It has to do with accepting the enemy of an enemy as a
friend, or perhaps at least an accomplice.

Michael JONES often congratulates Anders Breivik for massacring people
in Norway. His reason for supporting Breivik is that he said that all
of the people eliminated were Islamic Sleepers. What these are are
people who are secretly followers of Islam, being trained to subvertly
infiltrate Christian and Jewish society in order to destroy them.

You condemn Jihadists (Islamic Supremacists) as "nithings," supposedly the worst thing there is.

Then you call Michael JONES a nithing. Michael JONES calls you a satanic nazi.

So, you hate Michael JONES, Michael JONES hates you, and both of you hate Islamic Supremacists.

Since you have something in common, can't you find a way to get along?

I have directional couplers for the VHF and UHF bands I am concerned with and also access to a vector voltmeter. I am proficent in terminating cables with connectors but realizing there is more than one way to skin a cat and would also welcome input on assembling the cables.I am not looking to open a discussion on this but discussion would be welcome. Instead I am desiring direction to a website that has a tutorial on the subject. TIA Jimmie

OK, the best info I got was to play with a few cable samples and test equipment like I was going to use before building the cable. See how phase changes responds to trimming. There doesnt seem to be as much "magic" and "art" to it as some have claimed. Heliax with compression fittings make the job easy.

Jimmie

I sense doubt that the resolution of WWII caused the world to suffer.
What happened there was like a mother saying to her child, "Stop crying
or I will spank you some more." This was the new world policy. I am
not a parent, so I cannot say for certain whether this tactic works or
not, but it seems counter-intuitive to me.

Here's Tom with the numbers on whether any countries have died out since
'45. We will blame them all on this policy.

What a bunch of crap..

When you live in the past and all you do is re live the past - you will be stuck in time and can never move forward.

Hitler was stupid - if he would have picked on someone besides the jews - no one would have even paid him no mind.

The USA was so busy being the policeman of the world that it didn't bother to look at it's people and realize that the same old people were taking advantage of them as what we were fighting against.

While we used all of our technology to build rockets and bombs and planes - so was the USSR. The only difference between them and us was that they ran out of money first.

Free Enterprize only works when someone has something to gain.

When the Russians didn't allow anyone to make a profit - there was no incentive for them to do better.

Meanwhile the Chinese, Taiwan, Japan, India, Korea and all of the third world countries quietly made our electronic's and took over our manufacturing.
All of the semiconductor and transistor technology was given to them and by 1982 they discovered that TUBES were no longer the in thing and that anyone that could build electronic's that was solid state was going to be the manufacturers in vogue.

Over night the Collins, Heathkit etc manufacturers quietly went out of business while the ICOM / YAESU / KENWOOD people took over the communications world.

The only progress we have made since then is that the Chinese decided that the Japanese were making too much money and copied and made their product cheaper then everyone else.

The bottom line is that the American Consumer is a cheapo and doesn't appreciate quality - the only thing that concerns them is the price. Televisions, cell phones, I Pods etc - all the games - comes from across the pond.

Eventually the people we fought ended up owning the USA - and now the only way to keep the lights on and the people working is to exploit them - because the Japanese, Chinese etc has no way to collect on our debt.

Why would the Germans be mad at us?

Their Gross National Product, all of their wealth, everything they have - is a direct result of the American's being stupid and giving them money and buying their products and services.

ABB / Siemens / most of the electrical buisness comes from across the pond and the profits goes back to the mother land.

If you really want to do something significant with your life, try to figure out a way to bring back the American Way Of Life, Manufacturing, and the UNIONS.

OBAMA is going to have all of your guns, all of your money and you are going to be left wondering how all this happened!

The truth is - we are not FREE, we are just a little more independant then most everyone else..
As long as we work and we pay our taxes the government lets us alone.

This is the most retarded post I have read in a long time.

And you don't say anything at all.

I said:

"Germany would have accepted anything other than unconditional
surrender, because unconditional surrender is the worst thing known to
man. It means putting oneself at the mercy of thine enemies. Enemies
who tormented and tortured Germany after WWI. No goodwill expected."

You said:

"..."

Is this a new debate strategy that I have not encountered before? The
"silence as an opposition?" It seems kind of weak, but lets see how it
bears out. For one, I am in total lack of surprise when there is no
response to this message. Didn't you ever learn that surprise is the
key ingredient to meaningful discourse?

```
Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted twice monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:
```

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

It's because you are a stupid idiot and are not familiar with my debate style. For me, getting to the facts is more important than being right. You humans get on top of a side or position and ride it all the way to oblivion, never wavering and never changing, even when the facts completely obliterate your argument. I, on the other hand, do not mind playing Devil's Advocate. It is apparent in this discussion that by suppressing viewpoints, such as any support at all for any Axis power, you have laid yourself bare to anyone supporting them. You have no antibodies to fight such an assault because you allow no one to speak of it, and suppress it even though it is free speech, because it makes you grumpy and unhappy that there might be an enemy position.

So, wave your hands, and condemn the Axis as everything that is totally gruesomely evil and inhuman, and slowly but surely, in your inability to consider grey areas, they creep up and suffocate you in your comfortable little bed where you are happy like a clam and innocent in every way.

It is one thing to take the position of the Devil's Advocate, and
entirely something else to hold a postion based primarily on evil. I
believe you are occupying the latter territory. You speak of
antibodies as if they are translatable from human biology to thought
but they are not. This alone marks you as a force of irrationality
and non-thought.

Yeah, whatever. Your use of colorful language does not suffice to
disguise your lack of thought.

I have German ancestry. I would like to think that this does not make
me an unholy beast fit only for hard labor and slaughter in my
uncleanliness. You call me evil, but are you not the one who is quite
often in hysteria, caught up in paranoid delusion? I have been
condemned for playing Devil's Advocate in the past and it has cost me at

least one friend. However, I prefer to speak the salient points of the opposition so that they can be struck down, rather than to keep them unspoken and bothering; known but never resolved. Who are you to say that antibodies can not translate to human thought? I am more of a biologist than you are if history serves an example. As far as I can tell you are a gruff-whiskered survivalist, with a house full of hard cram rations and rum tankards filled with water instead of alcohol. You are ready for the apocalypse, because that is what you do, being ready for the apocalypse. How much does such a profession earn you?

>> So, wave your hands, and condemn the Axis as everything that is totally

Colorful language usually refers to the use of expletives. Are you running a smear campaign against me? You are evil and reprehensible. I bet you crawled up into your house along a tunnel straight out of hell. How many fellow demons are you in collaboration with? Does your pact of sinister evil have imps and hags in it? You are in cahoots with the worst this world has to offer and you are all after me.

No, that is your perception of the actuality. It is a fact that there
has been a great deal of hatemongering and such directed at my person.
It is denied (as you might expect) because the behavior is
indefensible and the moral standing driving it is repugnant.
Nevertheless there is a mindset that covets the "secret sin" and
values the breach of civics and law in itself as a privilage.
Accompanying this is a meme imputing freedom to mean freedom from law
or restraint, which these morons have assumed gives them a sense of
power.

Assume whatever you want; assume whatever it is that lays the
groundwork for what you want to think.

"Are you running a smear campaign against me?"

You really are a moron with no meaningful reason for being.

I suspected soc.culture.jewish would contain mostly opposition to my point. Since my points are so salient, I am looking for an argument rather than swift approval like I might find in rec.rational.debate. As for the time, I had just watched the fourth episode of Star Wars: Clone Commandos. The bad guy is apprehended attempting to flee the city and he asks them "what are the terms of my surrender?" They say, dripping with smugness, "unconditional." The bad guy goes, "Uh, okay."

I thought it would have made a better ending if instead he said, "Never!" and detonated a nuclear weapon inside his briefcase and the apprehenders who survived (up in space around the planet) had to fill out the worst paperwork ever.

Ok, I'm going to reply to all of your posts here without the group, rec.radio.shortwave There's no reason to include this group in your absurd rants. If you want to add them back in I can't stop that, but I can be just as annoying to you as you are to the rest of us.

No you cannot. I am the most annoying creature on Earth. The average
human gets no response to 1 out of 10 questions and statements. I get
no response to 6 out of every 10 questions and statements which is a
solid indication of this fact.

--
Who told you to think?
I don't give you enough
information to think.
You do what you're told, that's what you do.

Michael, you tried to tell us that Monsanto was run by Jews. I proved
you wrong. Now this. I suggest you find a Jewish psychiatrist to aid
you in dealing with this unhealthy obsession with Jews and
homosexuals. Obsession with homosexuals is almost always caused by
repressed homosexuality in the obsesser. But you knew that, didn't
you?

Don't be deceived by these slime bags. The company that

WWCR, so-called "Worldwide Christian radio", is owned by jewish
---
the jews own the xians.

homosexuals.
---
only religious myth believers persecute homosexuals.
